Section 2, The simulation method,	p.135

Chapter 1, The Continuous Bernoulli distribution

1.The probability density function of Continuous Bernoulli distribution

The Bernoulli distribution and parameter= p ,

$$f_x(x; p) = p^x (1-p)^{1-x}, x = 0, 1, 0 < p < 1,$$

X is discrete random variable,

Let X is continuous random variable and λ is the parameter which replaces p .

$$f_x(x; \lambda) = C(\lambda) \lambda^x (1-\lambda)^{1-x}, 0 \leq x \leq 1, 0 < \lambda < 1,$$

$$f_x(x; \lambda) = C(\lambda) (1-\lambda) \int_0^1 \left(\frac{\lambda}{1-\lambda} \right)^x dx --- (1.1),$$

$$(i) \lambda \neq \frac{1}{2}, (1.1) = C(\lambda) (1-\lambda) \frac{\left(\frac{\lambda}{1-\lambda} \right)^x}{\ln \left(\frac{\lambda}{1-\lambda} \right)} \Big|_0^1 = C(\lambda) \frac{2\lambda - 1}{\ln \left(\frac{\lambda}{1-\lambda} \right)} = 1,$$

$$C(\lambda) = \frac{\ln(1-\lambda) - \ln(\lambda)}{1-2\lambda},$$

$$(ii) \lambda = \frac{1}{2}, (1.1) = C(\lambda) \int_0^1 \frac{1}{2} dx = 2C(\lambda) = 1, C(\lambda) = 2,$$

Section 1, The Continuous Bernoulli distribution,

$X \sim CB(\lambda)$, this probability distribution for “machine learning”.

(1)The probability density function,

$$f_x(x; \lambda) = C(\lambda) \lambda^x (1-\lambda)^{1-x}, 0 \leq x \leq 1, 0 < \lambda < 1,$$

$$C(\lambda) = \begin{cases} \frac{2 \tanh^{-1}(1-2\lambda)}{1-2\lambda}, & \lambda \neq \frac{1}{2} \\ 2, & \lambda = \frac{1}{2} \end{cases}$$

$$\tanh^{-1}(x) = \frac{1}{2} \log_e \left(\frac{1+x}{1-x} \right) = \frac{1}{2} \ln \left(\frac{1+x}{1-x} \right), -1 < x < 1,$$

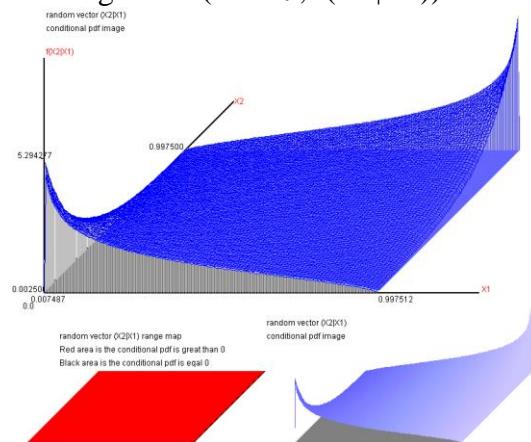

(2)The distribution function,

$$F_x(x; \lambda) = \begin{cases} \frac{\lambda^x (1-\lambda)^{1-x} + \lambda - 1}{2\lambda - 1}, & \lambda \neq \frac{1}{2}, 0 < x < 1 \\ x, & \lambda = \frac{1}{2} \end{cases}$$

(3) The λ is the shape parameter,

Let $X \sim \text{Continuous Bernoulli}(\lambda)$, the λ is the shape parameter from the below diagram. The $f(X|\lambda)$ is the conditional probability density in $\lambda, 0 < \lambda < 1$, but the $E(X)=\lambda$ is the function of λ .

The following diagram, let $X_2=X$, $X_1=\lambda$, $f(X_2|X_1)=f(X|\lambda)$,
the diagram is $(X_1=\lambda, f(X_2|X_1))$.

The red area is the range of (X, λ) .

Section 2, The simulator of Continuous Bernoulli distribution,

The inverse of $F_x(x; \lambda)$

$$x = \begin{cases} \frac{\log_e(F_x(x; \lambda) \times (2\lambda - 1) - (\lambda - 1)) - \log_e(1 - \lambda)}{\log_e\left(\frac{\lambda}{1 - \lambda}\right)}, & \lambda \neq \frac{1}{2} \\ F_x(x; \lambda), & \lambda = \frac{1}{2} \end{cases}$$

The random number = $RND = F_x(x; \lambda) \sim Uniform(0,1)$,

$$x \text{ simulated value} = \begin{cases} \frac{\log_e(RND \times (2\lambda - 1) - (\lambda - 1)) - \log_e(1 - \lambda)}{\log_e\left(\frac{\lambda}{1 - \lambda}\right)}, & \lambda \neq \frac{1}{2} \\ RND, & \lambda = \frac{1}{2} \end{cases}$$

(1) The simulated data generator,

do

{

getting RND ,

converting x simulated value,

}

(2) The probability distribution simulator,

The probability distribution simulated database,

do 100,000,000 times,

{

getting RND ,

converting x simulated value and saving the database,

}

This frequency distribution is likely to the probability density function, the sample mean of database is closed to the population mean and the relative error is below 1/10000.

Note: The computer program is C:\C_Bernoulli\C_Bernoulli_01.exe, which can compute the simulated data of Continuous Bernoulli distribution.

Section 3, The expectation and variance,

$$(1) \quad E(X) = C(\lambda)(1-\lambda) \int_0^1 x \left(\frac{\lambda}{1-\lambda} \right)^x dx --- (1.2),$$

$$(i) \lambda \neq \frac{1}{2}, (1.2) = C(\lambda)(1-\lambda) \left(x \times \frac{\left(\frac{\lambda}{1-\lambda} \right)^x}{\ln \left(\frac{\lambda}{1-\lambda} \right)} \Big|_0^1 - \int_0^1 \frac{\left(\frac{\lambda}{1-\lambda} \right)^x}{\ln \left(\frac{\lambda}{1-\lambda} \right)} dx \right)$$

$$= C(\lambda)(1-\lambda) \left(\frac{\lambda}{1-\lambda} - \frac{\left(\frac{\lambda}{1-\lambda} \right)^x}{\left(\ln \left(\frac{\lambda}{1-\lambda} \right) \right)^2} \Big|_0^1 \right)$$

$$= C(\lambda) \left(\frac{\lambda}{\ln(\lambda) - \ln(1-\lambda)} + \frac{1-2\lambda}{(\ln(\lambda) - \ln(1-\lambda))^2} \right)$$

$$(ii) \lambda = \frac{1}{2}, (1.2) = \int_0^1 x dx = 0.5,$$

$$\mu = E(X) = \begin{cases} \frac{\lambda}{2\lambda-1} + \frac{1}{2\tan^{-1}(1-2\lambda)} & \text{if } \lambda \neq \frac{1}{2} \\ \frac{1}{2} & \text{if } \lambda = \frac{1}{2} \end{cases}$$

$$(2) \quad E(X^2) = C(\lambda)(1-\lambda) \int_0^1 x^2 \left(\frac{\lambda}{1-\lambda} \right)^x dx --- (1.3),$$

$$(i) \lambda \neq \frac{1}{2}, (1.3) = C(\lambda)(1-\lambda) \left(x^2 \times \frac{\left(\frac{\lambda}{1-\lambda} \right)^x}{\ln \left(\frac{\lambda}{1-\lambda} \right)} \Big|_0^1 - 2 \int_0^1 \frac{x \left(\frac{\lambda}{1-\lambda} \right)^x}{\ln \left(\frac{\lambda}{1-\lambda} \right)} dx \right)$$

$$= C(\lambda) \left(\frac{\lambda}{\ln(\lambda) - \ln(1-\lambda)} \right) - 2E(X)$$

$$(ii) \lambda = \frac{1}{2}, (1.3) = \int_0^1 x^2 dx = \frac{1}{3},$$

$$Var(X) = E(X^2) - E^2(X),$$

$$Var(X) = \begin{cases} \frac{(1-\lambda)\lambda}{(1-2\lambda)^2} + \frac{1}{(2\tan^{-1}(1-2\lambda))^2} & \text{if } \lambda \neq \frac{1}{2} \\ \frac{1}{12} & \text{if } \lambda = \frac{1}{2} \end{cases}$$

The estimated equation of $E(X)$, $Var(X)$,

$$\gamma_1(X) = E\left[\left(\frac{X - E(X)}{\sqrt{Var(X)}}\right)^3\right], \gamma_2(X) = E\left[\left(\frac{X - E(X)}{\sqrt{Var(X)}}\right)^4\right],$$

$\gamma_1(X)$ is skewed coefficient and $\gamma_2(X)$ is kurtosis coefficient.

Continuous Bernoulli distribution computed $E(X)$, $Var(X)$, $\gamma_1(X)$ and $\gamma_2(X)$ is complexity, the estimated those moments using λ is easy way.

The Curvi-linear analysis(Taylor's expansion and regression combined) getting the mathematical model and computing the coefficients, the result could be accurately.

(1) $E(X) = G_1(\lambda)$, λ estimated $E(X)$,

The $E(X)$ estimated equation is $G_1(\lambda)$,

The $0.001 \leq \lambda \leq 0.999$, $0.143853919 \leq \mu \leq 0.856221427$,

The amount of paired data of $(\lambda, E(X))$ is 999, λ is setting value and $E(X)$ is computed by the simulator which has 100,000,000 data.

$X = 0.279390 + 0.441311 \times \lambda$,

The estimated equation-----

$$G_1(\lambda) = 0.50005887293491469 + \\ 0.77359483065083623 * (X - 0.50004573071171143)^1 + \\ -0.015152112930081785000000000000 * (X - 0.50004573071171143)^2 + \\ -27.27900934219360400 * (X - 0.50004573071171143)^3 + \\ 10.36370790004730200 * (X - 0.50004573071171143)^4 + \\ 15822.38842773437500000 * (X - 0.50004573071171143)^5 + \\ -2817.42468261718750000 * (X - 0.50004573071171143)^6 + \\ -3612752.6875 * (X - 0.50004573071171143)^7 + \\ 391281.72265625000000000 * (X - 0.50004573071171143)^8 + \\ 452401608.0000 * (X - 0.50004573071171143)^9 + \\ -31440996.2500 * (X - 0.50004573071171143)^10 + \\ -33874673664.0000 * (X - 0.50004573071171143)^11 + \\ 1540792624.0000 * (X - 0.50004573071171143)^12 + \\ 1582581137408.0000 * (X - 0.50004573071171143)^13 + \\ -46642316288.0000 * (X - 0.50004573071171143)^14 + \\ -46495537037312.0000 * (X - 0.50004573071171143)^15 + \\ 850124546048.0000 * (X - 0.50004573071171143)^16 + \\ 834533872107520.0000 * (X - 0.50004573071171143)^17 + \\ -8542741594112.0000 * (X - 0.50004573071171143)^18 + \\ -8357328558489600.0000 * (X - 0.50004573071171143)^19 + \\ 36339642531840.0000 * (X - 0.50004573071171143)^20 + \\ 35775834451083264.0000 * (X - 0.50004573071171143)^21$$

$(\lambda, \gamma_1(X))$ scatter diagram

$(\lambda, R=G_3(\lambda), B=\gamma_1(X))$ scatter diagram

(4) $\gamma_2(X)=G_4(\lambda)$, λ estimated $\gamma_2(X)$,

The $\gamma_2(X)$ estimated equation is $G_4(\lambda)$,

The $0.001 \leq \lambda \leq 0.999$, $1.799857270 \leq \gamma_2(X) \leq 7.0808074006$,

The amount of paired data of $(\lambda, \gamma_2(X))$ is 999, λ is setting value and $\gamma_2(X)$ is computed by the simulator which has 100,000,000 data.

$X=2.292589+0.000951 \times \lambda$,

The estimated equation -----

$(\lambda, \gamma_2(X))$ scatter diagram

$(\lambda, R=G_4(\lambda), B=\gamma_2(X))$ scatter diagram

Note: The computer program is C:\C_Bernoulli\C_Bernoulli_02.exe, which can compute the $E(X)$, $Var(X)$, $\gamma_1(X)$, $\gamma_2(X)$ and frequency table when Continuous Bernoulli distribution(λ). The simulated data amount=100,000,000, the sample mean, sample variance, sample skewed coefficient and sample kurtosis coefficient is closed to $E(X)$, $Var(X)$, $\gamma_1(X)$, $\gamma_2(X)$ and the frequency distribution is similar to Continuous Bernoulli distribution (λ).

Chapter 2, The sufficient statistic of Continuous Bernoulli distribution

The sufficient statistic of parameter is basis on the parameter point estimator and the test statistic and confidence interval statistic.

$X_1, X_2, \dots, X_n \stackrel{iid}{\sim} CB(\lambda)$, there are n independent random variables and same Continuous Bernoulli distribution (λ).

Section 1, The sufficient statistic of λ ,

(1) The likelihood function of λ ,

$X_1, X_2, \dots, X_n \stackrel{iid}{\sim} CB(\lambda)$,

$$f_{X_1, X_2, \dots, X_n}(x_1, x_2, \dots, x_n; \lambda) = \prod_{i=1}^n f_{X_i}(x_i; \lambda) = (C(\lambda))^n \lambda^{\sum_{i=1}^n x_i} (1-\lambda)^{n - \sum_{i=1}^n x_i},$$

(2) The sufficient statistic of λ ,

$$f_{X_1, X_2, \dots, X_n}(x_1, x_2, \dots, x_n; \lambda) = ((1-\lambda)C(\lambda))^n \left(\frac{\lambda}{1-\lambda} \right)^{\sum_{i=1}^n x_i},$$

$$\text{Let } T = \sum_{i=1}^n X_i, \quad 0 < x_n = t - \sum_{i=1}^{n-1} x_i < 1, \quad \sum_{i=1}^{n-1} x_i < t \quad \text{and} \quad \min(0, t-1) < \sum_{i=1}^{n-1} x_i,$$

$$f_T(t; \lambda) = \int_0^1 \int_0^1 \dots \int_0^1 (C(\lambda))^n \lambda^t (1-\lambda)^{n-t} dx_1 dx_2 \dots dx_{n-1},$$

$$f_{X_1, X_2, \dots, X_n|T=t}(x_1, x_2, \dots, x_n | T=t) = \frac{((1-\lambda)C(\lambda))^n \left(\frac{\lambda}{1-\lambda} \right)^{\sum_{i=1}^n x_i}}{\int \int \dots \int (C(\lambda))^n \lambda^t (1-\lambda)^{n-t} dx_1 dx_2 \dots dx_{n-1}}$$

$$= \frac{1}{\int \int \dots \int 1 dx_1 dx_2 \dots dx_{n-1}} \text{ is independent with } \lambda,$$

$\sum_{i=1}^n X_i$ is the sufficient statistic of λ , (Fisher-Neyman factorization theorem).

Section 2, The sampling distribution of $\sum_{i=1}^n X_i$ is Continuous Binomial(n, λ),

$X_1, X_2, \dots, X_n \stackrel{iid}{\sim}$ Continuous Bernoulli(λ),

1. The $X = X_1 + X_2 + \dots + X_n$ pdf,

(1) n=2,

The probability density function,

$$f_{X_1}(x_1; \lambda, n) = C(\lambda) \lambda^{x_1} (1-\lambda)^{1-x_1}, 0 \leq x_1 \leq 1, 0 < \lambda < 1,$$

$$f_{X_2}(x_2; \lambda, n) = C(\lambda) \lambda^{x_2} (1-\lambda)^{1-x_2}, 0 \leq x_2 \leq 1, 0 < \lambda < 1,$$

X_1, X_2 are independent random variables,

$$f_{X_1, X_2}(x_1, x_2; \lambda, n) = f_{X_1}(x_1; \lambda, n) f_{X_2}(x_2; \lambda, n)$$

$$= (C(\lambda))^2 \lambda^{x_1+x_2} (1-\lambda)^{2-x_1-x_2}, 0 \leq x_1 \leq 1, 0 \leq x_2 \leq 1,$$

$$f_{X_1, X}(x_1, x; \lambda, n) = f_{X_1, X_2}(x_1, x - x_1; \lambda, n),$$

$$= (C(\lambda))^2 \lambda^x (1-\lambda)^{2-x} \times \frac{\partial(x_1, x_2)}{\partial(x_1, x)}, \frac{\partial(x_1, x_2)}{\partial(x_1, x)} = 1,$$

$$X = X_1 + X_2, 0 < x_2 = x - x_1 < 1,$$

$$\max(0, x-1) < x_1 < \min(1, x), 0 \leq x \leq 2,$$

$$\begin{cases} 0 < x_1 < x & \text{if } 0 \leq x \leq 1, \\ x-1 < x_1 < 1 & \text{if } 1 \leq x \leq 2, \end{cases}$$

$$f_X(x; \lambda, n) = \int_{\max(0, x-1)}^{\min(1, x)} (C(\lambda))^2 \lambda^x (1-\lambda)^{2-x} dx_1$$

$$\begin{cases} f_X(x; \lambda, n) = (C(\lambda))^2 \lambda^x (1-\lambda)^{2-x} \int_0^x 1 dx_1 & \text{if } 0 \leq x \leq 1, \\ f_X(x; \lambda, n) = (C(\lambda))^2 \lambda^x (1-\lambda)^{2-x} \int_{x-1}^1 1 dx_1 & \text{if } 1 \leq x \leq 2, \end{cases}$$

$$f_X(x; \lambda, n) = \begin{cases} (C(\lambda))^2 x \lambda^x (1-\lambda)^{2-x} & \text{if } 0 \leq x \leq 1 \\ (C(\lambda))^2 (2-x) \lambda^x (1-\lambda)^{2-x} & \text{if } 1 \leq x < 2 \end{cases}$$

for example, $\lambda = \frac{1}{2}$,

$$f_X(x; \lambda, n) = \begin{cases} x & \text{if } 0 \leq x \leq 1 \\ 2-x & \text{if } 1 \leq x \leq 2 \end{cases}$$

(1) $\lambda = 0.1, n=2, X = X_1 + X_2 + \dots + X_n$,

$X \sim$ Continuous Binomial distribution(λ),

$X_1, X_2, \dots, X_n \stackrel{iid}{\sim} \text{Uniform}(\alpha = 0, \beta = 1)$,

$X = X_1 + X_2 + \dots + X_n, h(x)$ is irwin-hall distribution and parameter n .

The pdf of Continuous Binomial distribution(λ) is

$$f_X(x; \lambda, n) = h(x)(C(\lambda))^n \lambda^x (1-\lambda)^{n-x}, 0 \leq x \leq n, 0 < \lambda < 1.$$

and $X = \sum_{i=1}^n X_i \xrightarrow{n \rightarrow \infty} \text{Normal}\left(E\left(X = \sum_{i=1}^n X_i\right), \text{Var}\left(X = \sum_{i=1}^n X_i\right)\right)$.

Section 3, The simulator of $\sum_{i=1}^n X_i$,

The Continuous Bernoulli simulated data $x(RND, \lambda)$ when random number= RND and parameter is λ ,

$$x(RND, \lambda) = \begin{cases} \frac{\log_e(RND \times (2\lambda - 1) - (\lambda - 1)) - \log_e(1 - \lambda)}{\log_e\left(\frac{\lambda}{1 - \lambda}\right)}, & \lambda \neq \frac{1}{2} \\ RND, & \lambda = \frac{1}{2} \end{cases},$$

(1)The simulation process,

(i) Getting random number, $RND_1, RND_2, \dots, RND_n$ are independently,

(ii) $x_1(RND_1, \lambda), x_2(RND_2, \lambda), \dots, x_n(RND_n, \lambda)$

(iii) $x_j = \sum_{i=1}^n x_i(RND_i, \lambda)$, $j=1, 2, \dots, 100000000$,

Repeat (i)~(iii) 100000000 times, the database of simulated data will be gotten.

This database can convert frequency distribution and $E(X)$, $Var(X)$, $\gamma_1(X)$, $\gamma_2(X)$, This database is approached to Continuous Binomial distribution(λ).

(1)n=2, $\lambda=0.1$, W24= $X_1 + X_2 + \dots + X_n$,

Note: The computer program is C:\C_Bernoulli\C_Bernoulli_03.exe, which can

compute the sample mean ($\bar{X} = \frac{X_1 + X_2 + \dots + X_n}{n}$) sampling distribution of

Continuous Bernoulli distribution.

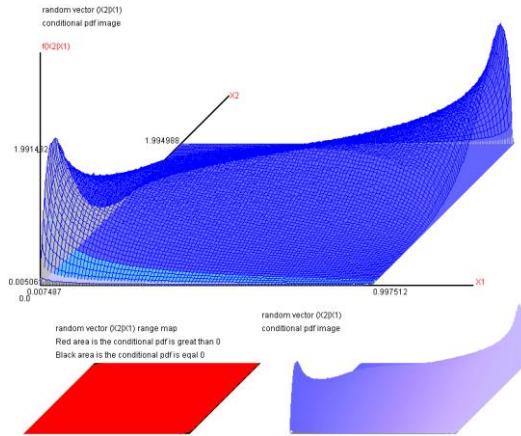

$$\text{Section 4, } \sum_{i=1}^n X_i \xrightarrow{n \rightarrow \infty} \text{Normal}\left(E\left(\sum_{i=1}^n X_i\right), \text{Var}\left(\sum_{i=1}^n X_i\right)\right),$$

$X_1, X_2, \dots, X_n \stackrel{iid}{\sim} CB(\lambda)$, $X_2 = \sum_{i=1}^n X_i$, the simulator and transformation can get

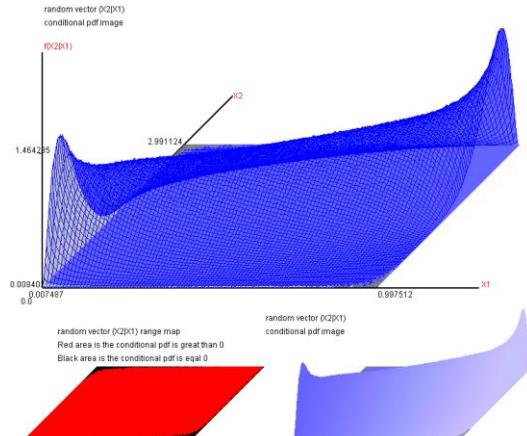

$f(X_2|X_1=\lambda)$, $0 < \lambda < 1$, the simulated data number=1,000,000,000.

The diagram is $(X_1=\lambda, f(X_2|X_1))$.

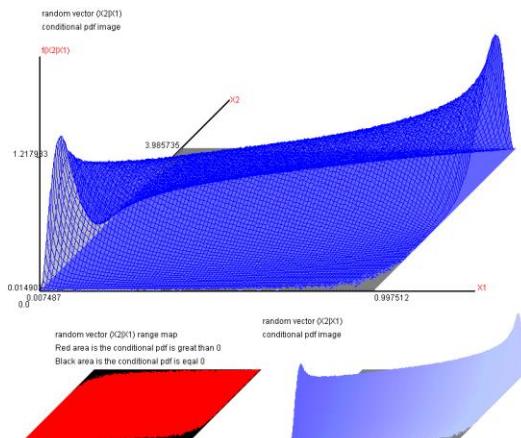

$n = 2$,

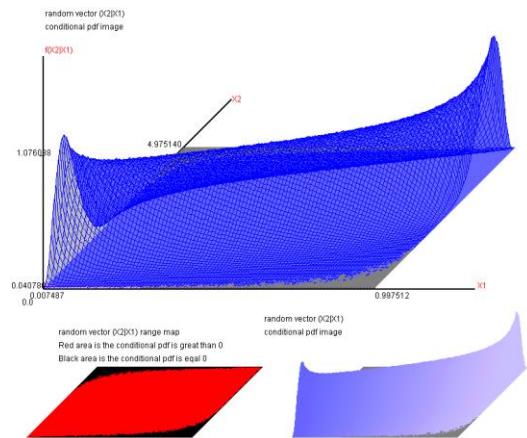

$n = 3$,

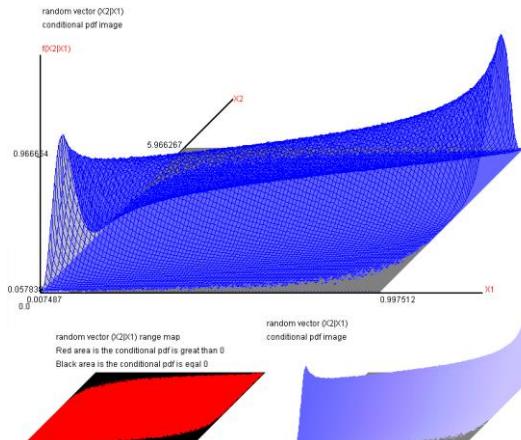

$n = 4$,

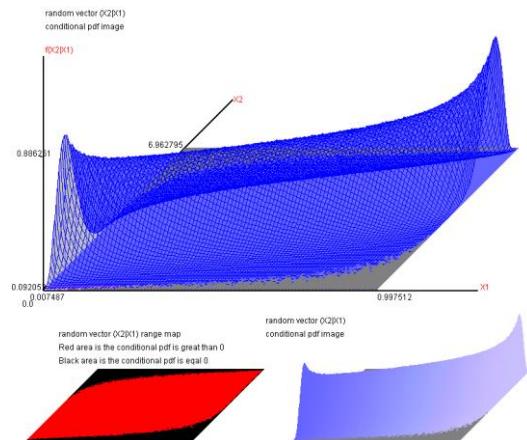

$n = 5$,

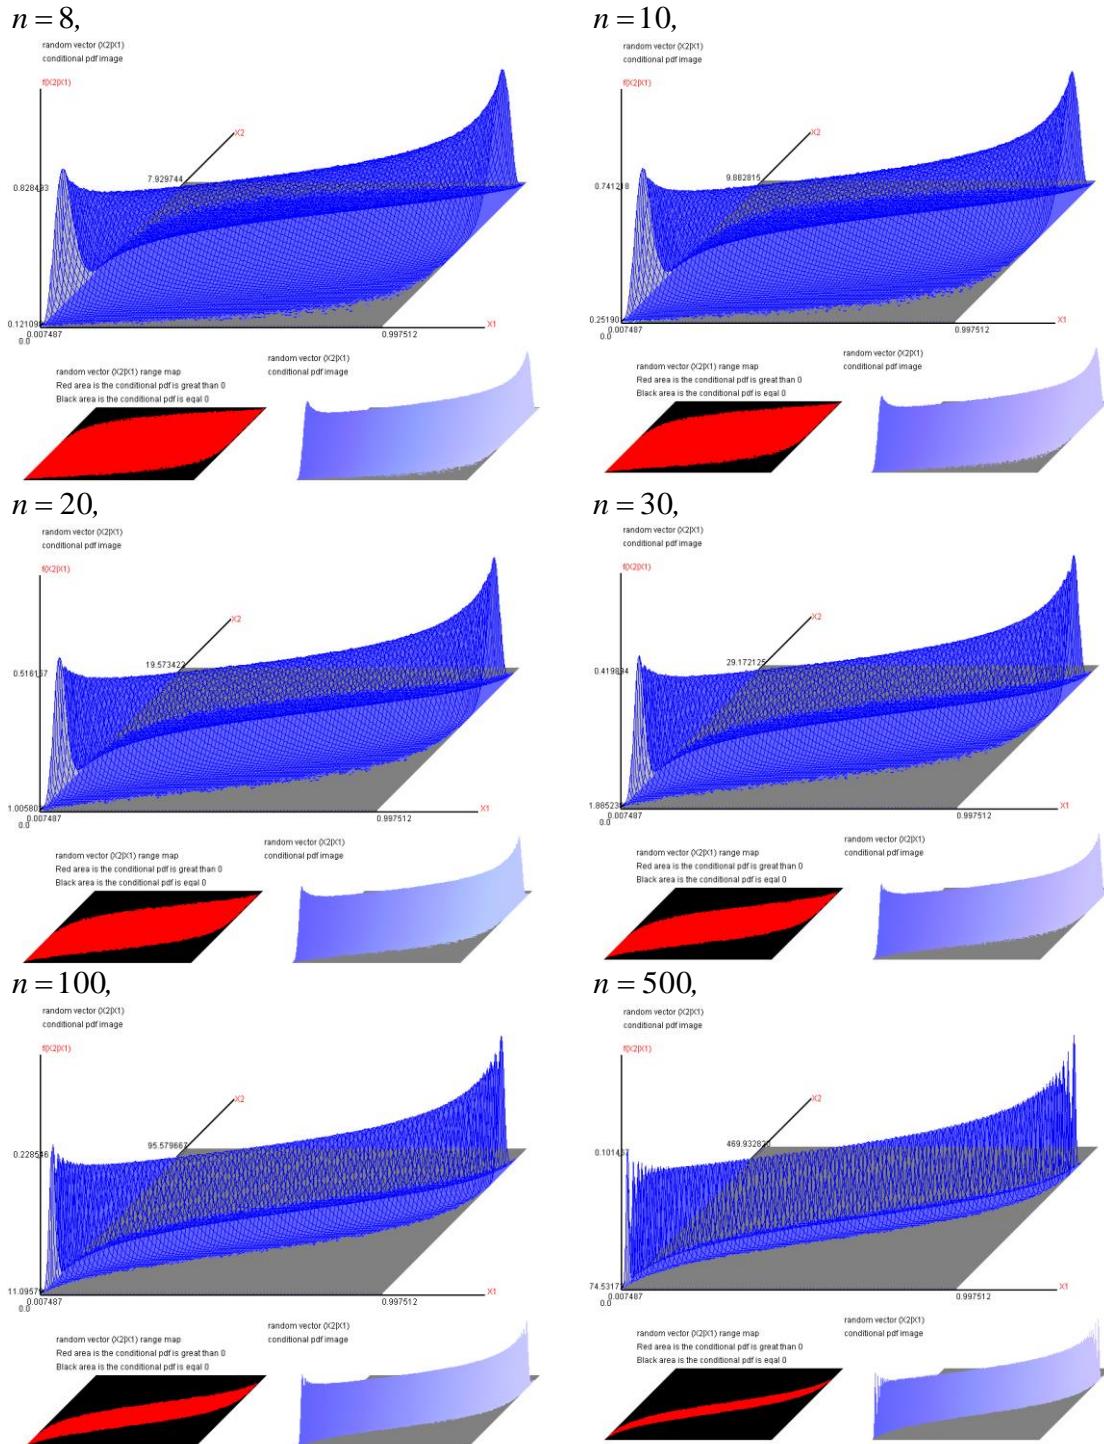

$n = 6$,

$n = 7$,

The red area is the range of $(\sum_{i=1}^n X_i, \lambda)$.

The λ in $\sum_{i=1}^n X_i$ which is changed to the shape parameter to the location parameter

when n is very large. When $X_1, X_2, \dots, X_n \stackrel{iid}{\sim} CB(\lambda)$ and n is very large ($n \geq 500$),

$$\sum_{i=1}^n X_i \xrightarrow{n \rightarrow \infty} Normal\left(E\left(\sum_{i=1}^n X_i\right), Var\left(\sum_{i=1}^n X_i\right)\right).$$

Chapter 3, The λ point estimator of Continuous Bernoulli distribution

$X_1, X_2, \dots, X_n \stackrel{iid}{\sim} CB(\lambda)$, n random samples come from the Continuous Bernoulli distribution (λ) .

Section 1, UMVU(Uniformly minimum variance unbiased),

$$E\left(\sum_{i=1}^n X_i\right) = \sum_{i=1}^n E(X_i) = n\mu, E\left(\bar{X} = \frac{\sum_{i=1}^n X_i}{n}\right) = \mu,$$

$$\mu = E(X) = \begin{cases} \frac{\lambda}{2\lambda-1} + \frac{1}{2\tan^{-1}(1-2\lambda)} & \text{if } \lambda \neq \frac{1}{2} \\ \frac{1}{2} & \text{if } \lambda = \frac{1}{2} \end{cases}.$$

Let $U(\bar{X})$ is the function of λ and $E(U(\bar{X})) = \lambda$, but $U(\bar{X})$ cannot be found. The λ of UMVUE is not existed.

Section 2, Maximum likelihood estimator,

$$L(\lambda|x_1, x_2, \dots, x_n) = (C(\lambda))^n \lambda^{\sum_{i=1}^n x_i} (1-\lambda)^{n-\sum_{i=1}^n x_i},$$

$$\ln L(\lambda|x_1, x_2, \dots, x_n) = n \ln(C(\lambda)) + \sum_{i=1}^n x_i \times \ln(\lambda) + \left(n - \sum_{i=1}^n x_i\right) \times \ln(1-\lambda),$$

$$\frac{d \ln L(\lambda|x_1, x_2, \dots, x_n)}{d\lambda} = \frac{n C'(\lambda)}{C(\lambda)} + \frac{\sum_{i=1}^n x_i}{\lambda} - \frac{n - \sum_{i=1}^n x_i}{1-\lambda} = 0,$$

$$\frac{n C'(\lambda)}{C(\lambda)} + \frac{\sum_{i=1}^n x_i - n\lambda}{\lambda \times (1-\lambda)} = 0, \quad \bar{x} = \frac{\sum_{i=1}^n x_i}{n} = \frac{\lambda}{\lambda \times (1-\lambda)} - \frac{C'(\lambda)}{C(\lambda)},$$

$\hat{\lambda} = \phi(\bar{x})$, $\phi(\)$ cannot be derived from the above equation,

Section 3, The λ point estimator using sufficient statistic and estimated equation,

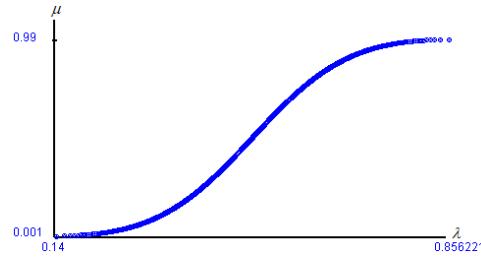

From chapter 2 and section 3, the μ and λ is one to one, $E(X)$ can be computed using Monte Carlo method and the relative error below 1/10000. This is a way to find the MLE of λ but using the software program and numerical analysis. It is the remedy method to construct the function of λ using μ , the analytics process is below,

$$(1) \lambda = \phi^*(\mu), E(X) = \mu, \text{ the } \lambda \text{ estimated equation of } \mu,$$

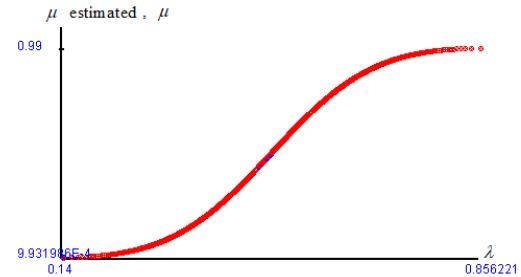

The λ estimated μ using curvi-linear model (Taylor's expansion and regression analysis) and μ is computed by the simulator in λ specific range (appendix 2).

The $0.001 \leq \lambda \leq 0.999, 0.143853919 \leq \mu \leq 0.856221427$,

(i) (λ, μ) scatter diagram,

(ii) (λ, μ) , Red is μ estimated, Blue is μ ,

$$(2) \lambda = \phi^*(\mu), \phi^*(\mu) \text{ estimated equation},$$

The estimated equation,

$$X = -0.596698 + 2.193196 \times \mu,$$

$$\begin{aligned} \lambda = & 0.49997386580423608 + 1.36802409685464270 * (X - 0.5056)^1 + \\ & -0.000924747670069336890 * (X - 0.5056)^2 + -2.73607823707760640 * (X - 0.5056)^3 + \\ & 0.095109043642878532 * (X - 0.5056)^4 + 5.7483773675921839 * (X - 0.5056)^5 + \\ & -1.8419988453388214 * (X - 0.5056)^6 + -12.357242575206328 * (X - 0.5056)^7 + \\ & 16.361405849456787 * (X - 0.5056)^8 + 26.41792850010097 * (X - 0.5056)^9 + \\ & -80.02126121520996 * (X - 0.5056)^10 + -48.621550429612398 * (X - 0.5056)^11 + \\ & 228.76872253417969 * (X - 0.5056)^12 + 64.702439151704311 * (X - 0.5056)^13 + \\ & -380.75874328613281 * (X - 0.5056)^14 + -51.895506033673882 * (X - 0.5056)^15 + \\ & 341.66360473632812 * (X - 0.5056)^16 + 18.360968290828168 * (X - 0.5056)^17 + \\ & -127.70810317993164 * (X - 0.5056)^18, \end{aligned}$$

ANOVA

Source	df	SS	MS
Regression	18	83.0834922851	4.6157495714
Error	980	0.0000077149	0.0000000079
Total	998	83.0835000000	

H0:slope1=....=slope18=0, test statistic=586328245.808614, p value=0.000000, sample size=999, R2=1.000000, R2(adj)=1.000000, MSE=0.000000,

The $R^2 \rightarrow 1$ and $MSE=0$, $\phi^*(\)$ is not error when $\phi^*(\mu)$ converting λ .

$\phi(\)$ estimated equation is $\phi^*(\)$, the MLE of λ which estimated equation is $\hat{\lambda} = \phi(\bar{x}) = \phi^*(\bar{x})$.

(3) $\hat{\lambda} = \phi(\bar{X})$, $\phi(\bar{X})$ is λ MLE estimated equation,

$$\bar{X} = \mu + \varepsilon, E(\varepsilon) = 0, E(\varepsilon^2) = \frac{Var(X)}{n} \xrightarrow{n \rightarrow \infty}, \varepsilon \xrightarrow{n \rightarrow \infty} 0.$$

The $\lambda = \phi^*(\mu), \phi^*(\bar{X} - \varepsilon) \xrightarrow{n \leftarrow \infty} \phi^*(\bar{X})$, λ MLE = $\phi(\bar{X}) = \phi^*(\bar{X})$.

$\phi(\bar{X})$ hqw asymptotic unbiased, $E(\phi(\bar{X})) \neq \lambda$, but $E(\phi(\bar{X})) \xrightarrow{n \rightarrow \infty} \lambda$, the estimated error is very small can be seen as 0.

But $\lambda = 0.5$, $E(\bar{X}) = \lambda = 0.5$, the λ MLE = \bar{X} is unbiased estimator if $\lambda = 0.5$.

(4) The limitation of estimated equation, $\phi(\bar{X})$,

$0.143853919 \leq \bar{X} \leq 0.856221427$, the $\hat{\lambda} = \phi(\bar{X})$ could be reasonable number which is $0.001 \leq \hat{\lambda} \leq 0.999$.

Section 4, The simulator of $\hat{\lambda} = \phi(\bar{X})$ sampling distribution,

(1)The simulation process,

(i) Getting random number, $RND_1, RND_2, \dots, RND_n$ are independently,

(ii) $x_1(RND_1, \lambda), x_2(RND_2, \lambda), \dots, x_n(RND_n, \lambda)$

(iii) $\hat{\lambda}_j = \phi\left(\frac{\sum_{i=1}^n x_i(RND_i, \lambda)}{n}\right), j=1, 2, \dots, 100000000, \phi(\)$ is estimated function.

Repeat (i)~(iii) 100000000 times, the database of simulated data will be gotten.

This database can convert frequency distribution and $E(\hat{\lambda}), Var(\hat{\lambda}), \gamma_1(\hat{\lambda}), \gamma_2(\hat{\lambda})$,

This database is approached to Continuous Binomial distribution(λ).

Note: The computer program is C:\C_Bernoulli\C_Bernoulli_04.exe, which can compute the $\hat{\lambda} = \phi(\bar{X})$ sampling distribution of Continuous Bernoulli distribution.

Section 5, $\hat{\lambda}$ being the consistent point estimator,

The simulator data to verified $E(\phi(\bar{X})) \xrightarrow{n \rightarrow \infty} \lambda$ and $Var(\phi(\bar{X}))$ closing to 0.

(5-1) The sampling distribution $\hat{\lambda} = \phi(\bar{X})$,

$$E(\hat{\lambda}) \xrightarrow{n \rightarrow \infty} \lambda \text{ and } Var(\hat{\lambda}) \xrightarrow{n \rightarrow \infty} 0 \text{ and } Var(\hat{\lambda}) \xrightarrow{n \rightarrow \infty} E((\hat{\lambda} - \lambda)^2).$$

The simulated data number of each time is 100,000,000.

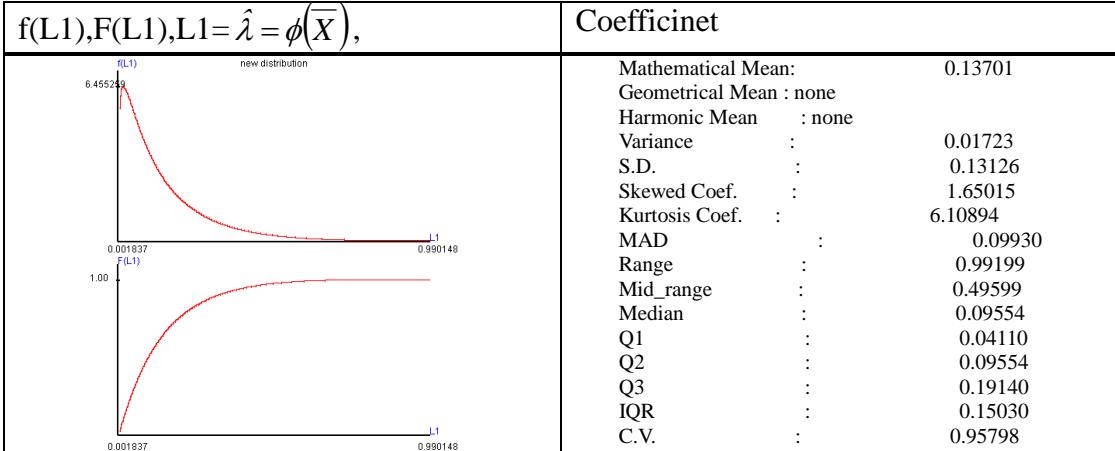

(5-1),

$$X_1, X_2, \dots, X_n \stackrel{iid}{\sim} CB(\lambda), \lambda = 0.1, E(X) = 0.33015, \text{sigma}(X) = 0.25791, \text{Var}(X) = 0.06652,$$

Section 6, $\hat{\lambda} = \phi(\bar{X}) \xrightarrow{n \rightarrow \infty} \text{Normal}(E(\hat{\lambda}), \text{Var}(\hat{\lambda}))$,

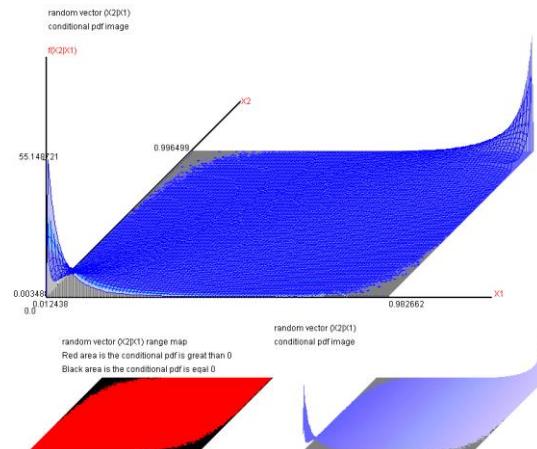

The simulator and transformation can get $\hat{\lambda} = \phi(\bar{X})$ sampling distribution and conditional probability density function in λ to be explained.

Let $X_2 = \hat{\lambda} = \phi(\bar{X})$ and $f(X_2|X_1=\lambda)$, the simulated data number=100,000,000.

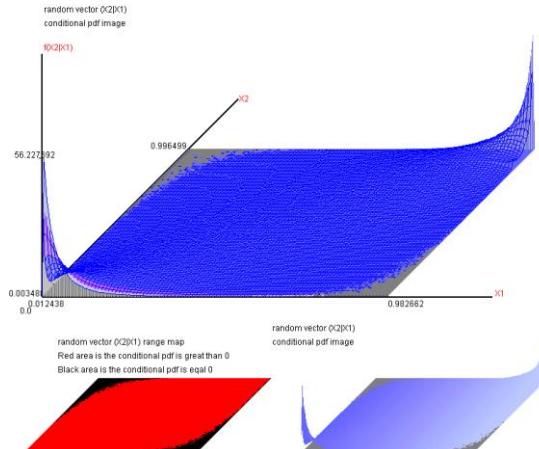

(5-2-1) $0.01 \leq \lambda \leq 0.99$ for $E(\hat{\lambda}) \xrightarrow{n \rightarrow \infty} \lambda$ and $\text{Var}(\hat{\lambda}) \xrightarrow{n \rightarrow \infty} 0$.

The diagram is $(X_1=\lambda, f(X_2|X_1))$.

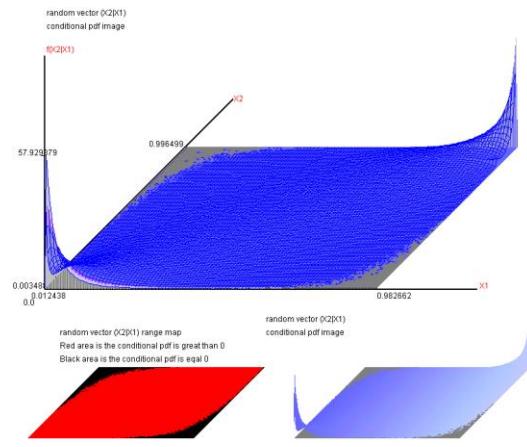

$n = 10$,

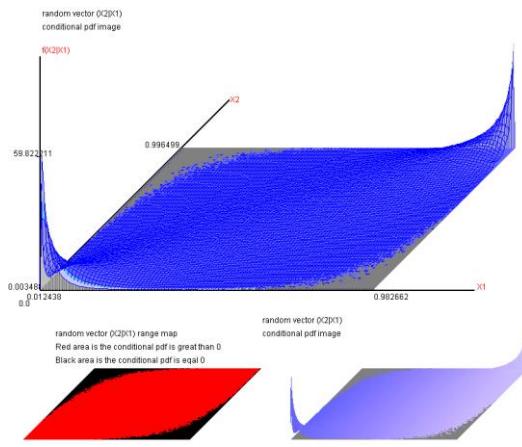

$n = 11$,

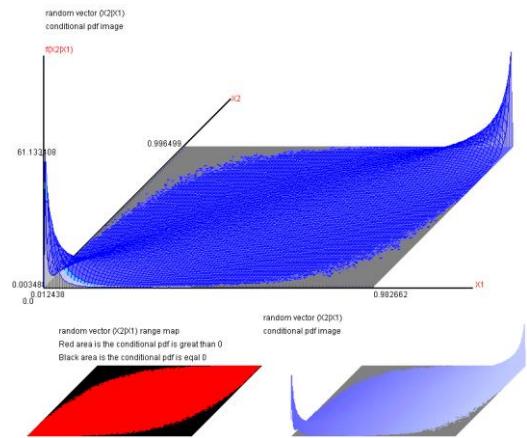

$n = 12$,

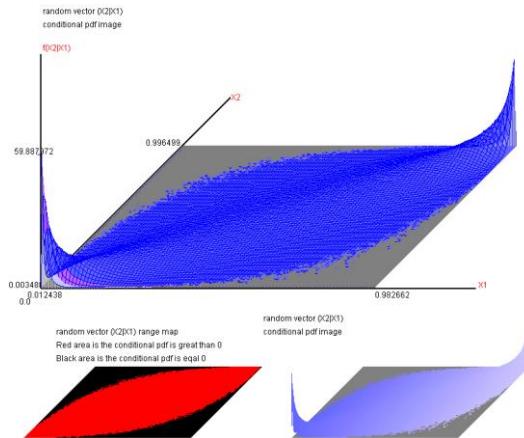

$n = 15$,

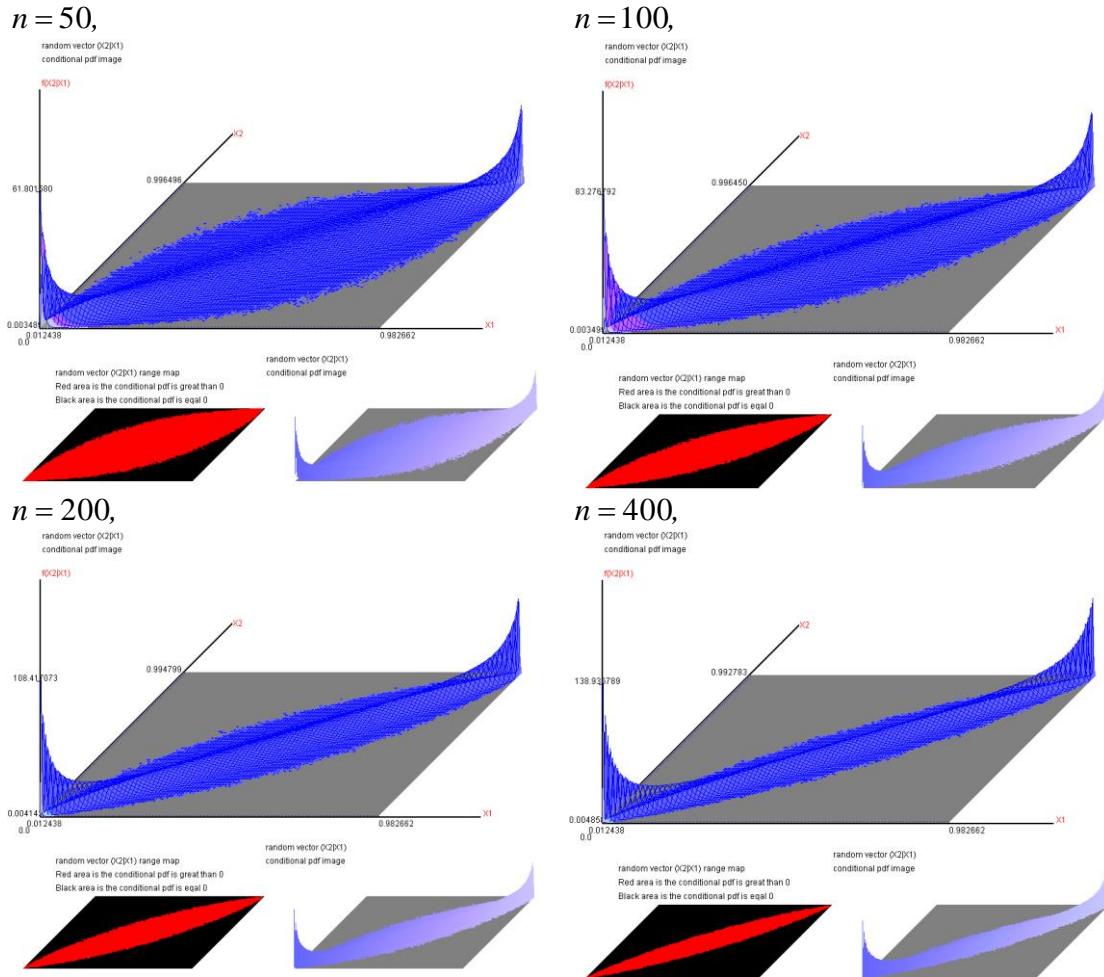

$n = 20$,

$n = 30$,

The red area is the range of $(\hat{\lambda} = \phi(\bar{X}), \lambda)$.

From $n=10, 11, 12, 15, 20, 30, 50$, $(\lambda, E(\hat{\lambda}))$ diagram is not 45^0 line.

From $n=100, 200$, $(\lambda, E(\hat{\lambda}))$ diagram is approaching to 45^0 line.

$n=400$, $(\lambda, E(\hat{\lambda}))$ diagram is close to 45^0 line,

$E(\hat{\lambda}) \xrightarrow{n \rightarrow \infty} \lambda$ and $Var(\hat{\lambda}) \xrightarrow{n \rightarrow \infty} 0$, but $E(\bar{X}) = \lambda = 0.5$ if $\lambda = 0.5$ in any sample size.

Chapter 4, The test statistic of Continuous Bernoulli distribution

$X_1, X_2, \dots, X_n \sim CB(\lambda)$, n random samples from $CB(\lambda)$.

There are two test statistic,

one is $\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)}$, the other is $\frac{\hat{\lambda} - E(\hat{\lambda})}{\sqrt{Var(\hat{\lambda})}}$, but $\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)}$ is better than $\frac{\hat{\lambda} - E(\hat{\lambda})}{\sqrt{Var(\hat{\lambda})}}$.

Section 1, The difference of and $\frac{\hat{\lambda} - E(\hat{\lambda})}{\sqrt{Var(\hat{\lambda})}}$,

The $\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)}$ and $\frac{\hat{\lambda} - E(\hat{\lambda})}{\sqrt{Var(\hat{\lambda})}}$ sampling distributions

when $X_1, X_2, \dots, X_n \sim CB(\lambda)$, $\bar{X} = \frac{\sum_{i=1}^n X_i}{n}$, $\hat{\lambda} = \phi(\bar{X})$ (chapter 3, section 3).

The $\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)} \xrightarrow[n \geq n(\bar{X})]{} Normal(0,1)$ and $\frac{\hat{\lambda} - E(\hat{\lambda})}{\sqrt{Var(\hat{\lambda})}} \xrightarrow[n \geq n(\lambda)]{} Normal(0,1)$,

because $\hat{\lambda} = \phi(\bar{X})$ is the non-linear function of \bar{X} and $E(\hat{\lambda}) \neq \lambda$, $n(\bar{X})$ is less than $n(\lambda)$, $\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)}$ is the good test statistic.

(1) $n(\bar{X}) = ?$ when $\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)} \xrightarrow[n \geq n(\bar{X})]{} Normal(0,1)$,

W15 = $\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)} \xrightarrow[n \geq n(\bar{X})]{} Normal(0,1)$,

Getting the simulated data of W15 and standard normal distribution using the simulator and the simulated data number=100,000,000.

Calculating the $n(\bar{X})$ using the Strong Law of Large Number, the requirement is

$$P\{|F_{W15}(W15) - \Phi(W15)| < 0.1\} = 1, P\{|F_{W15}(W15) - \Phi(W15)| < 0.05\} = 1,$$

$$P\{|F_{W15}(W15) - \Phi(W15)| < 0.01\} = 1, P\{|F_{W15}(W15) - \Phi(W15)| < 0.005\} = 1,$$

when $\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)} \rightarrow Normal(0,1)$.

$\Phi(z) = P(Z \leq z) = \int_{-\infty}^z \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{z^2}{2}\right) dz$ is the distribution function of standard

normal distribution.

$$(1-1) \lambda = 0.5, n(\bar{X}) = 6,$$

 $\Pr(|W15 \text{ distribution function} - Z \text{ distribution function}| < 0.0001000000) = 0.015426,$

$$(2) \quad n(\lambda) = ? \quad W1 = \frac{\hat{\lambda} - E(\hat{\lambda})}{\sqrt{Var(\hat{\lambda})}} \xrightarrow{n(\lambda) \rightarrow \infty} Normal(0,1),$$

Getting the simulated data of W1 and standard normal distribution using the simulator and the simulated data number=100,000,000.

Calculating the $n(\lambda)$ using the Strong Law of Large Number, the requirement is

$$P\{F_{W1}(W1) - \Phi(W1) < 0.1\} = 1, \quad P\{F_{W1}(W1) - \Phi(W1) < 0.05\} = 1,$$

$$P\{F_{W1}(W1) - \Phi(W1) < 0.01\} = 1, \quad P\{F_{W1}(W1) - \Phi(W1) < 0.005\} = 1,$$

when $\frac{\hat{\lambda} - E(\hat{\lambda})}{\sqrt{Var(\hat{\lambda})}} \rightarrow Normal(0,1)$.

$\Phi(z) = P(Z \leq z) = \int_{-\infty}^z \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{z^2}{2}\right) dz$ is the distribution function of standard

normal distribution.

$$(2-1) \quad n(\lambda = 0.5) = 100,$$

$$\text{Section 2, } f\left(\frac{\sqrt{n}(X) - \mu(X)}{\sigma(X)} | \lambda\right),$$

$$X_2 = \frac{\sqrt{n}(X) - \mu(X)}{\sigma(X)}, \text{ the simulator and transformation can get } f(X_2|X_1=\lambda), \quad 0 < \lambda < 1,$$

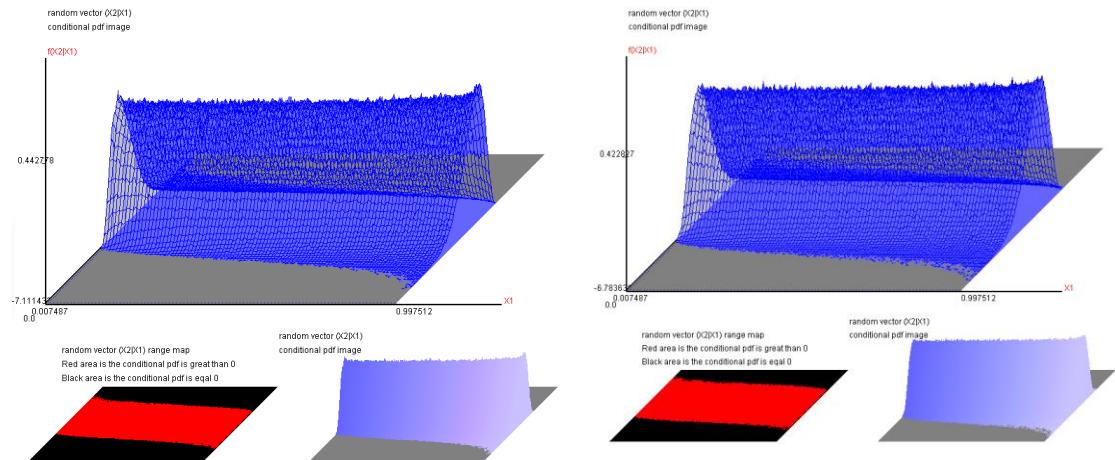

the simulated data number=100,000,000.

The probability distribution shape is affected by sample size and λ .

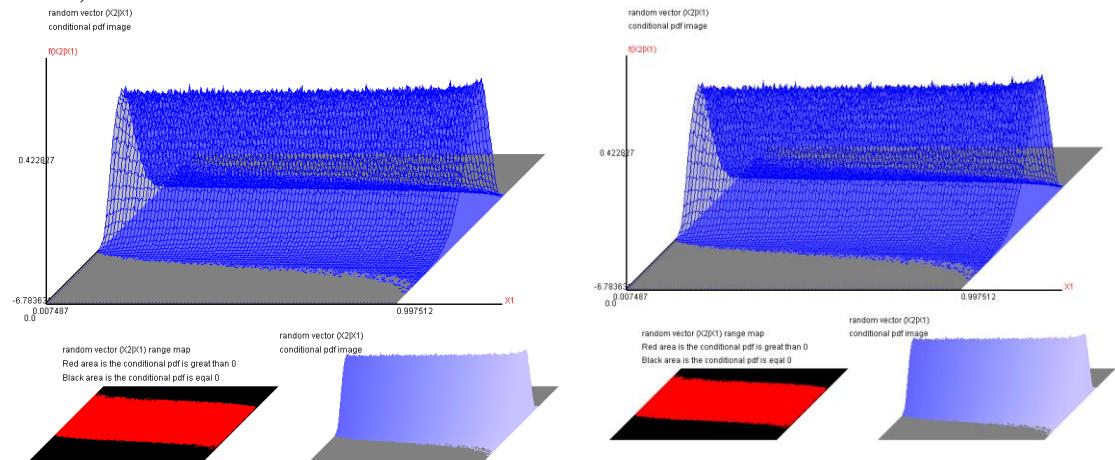

$n=2$,

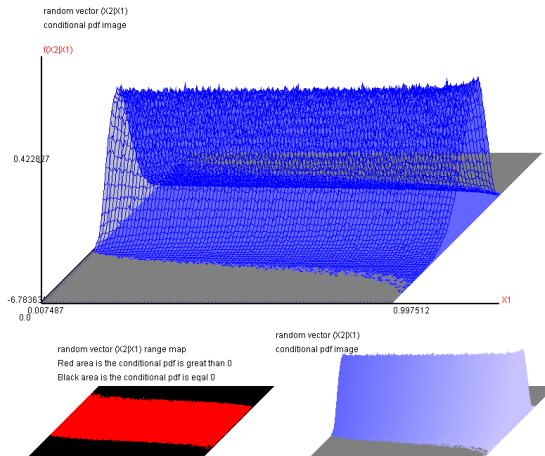

$n=4$

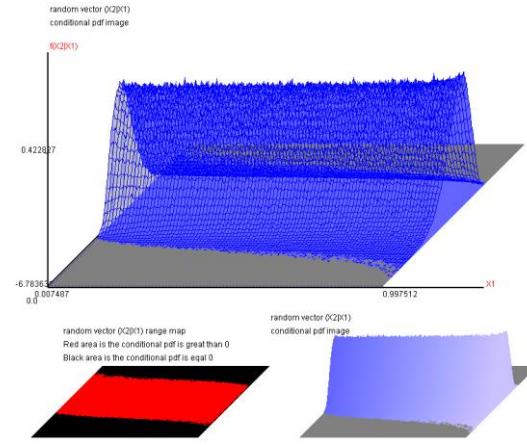

$n=10$,

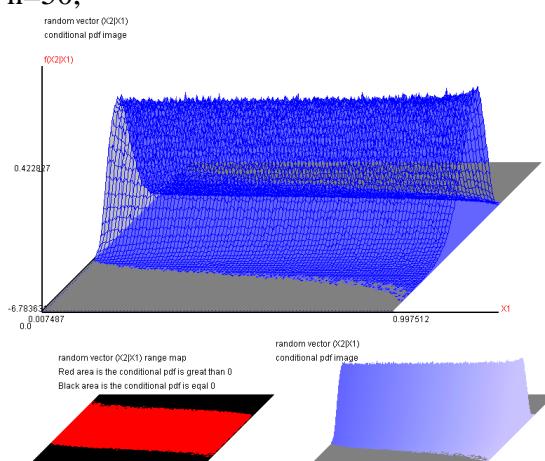

$n=20$,

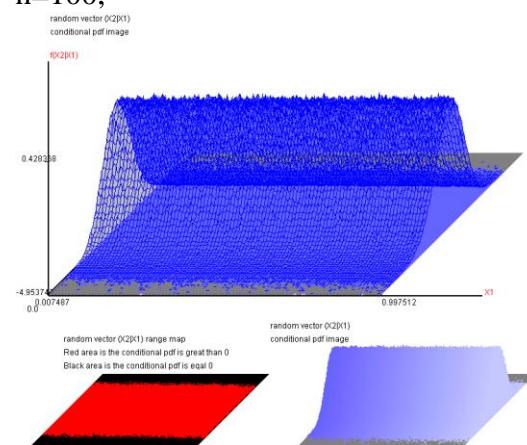

$n=25$

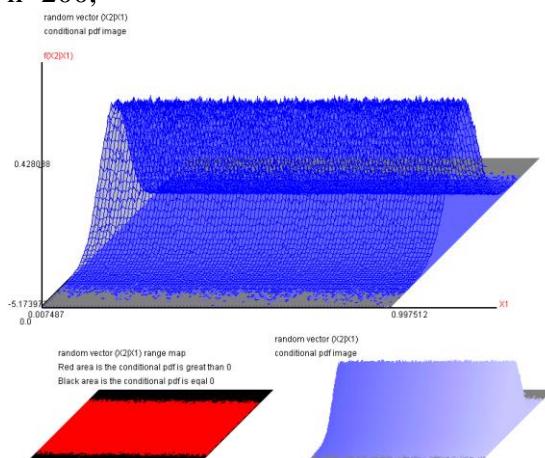

$n=50$,

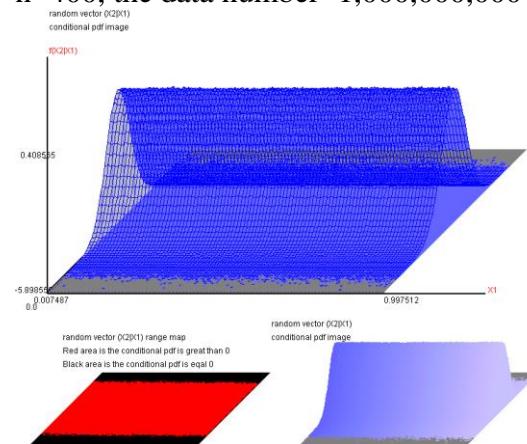

$n=100$,

$n=200$,

$n=400$, the data number=1,000,000,000

Section 3, $f\left(\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)}\right)$ |n=sample size),

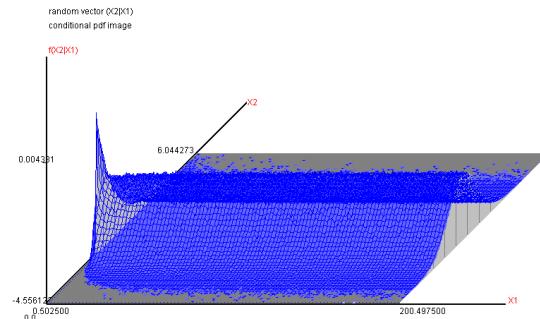

$$f\left(\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)}\right) | n,$$

$$X2 = \frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)} \text{ and } X1 = n = \text{sample size and } n=1,2,\dots,200, \text{ the simulated data}$$

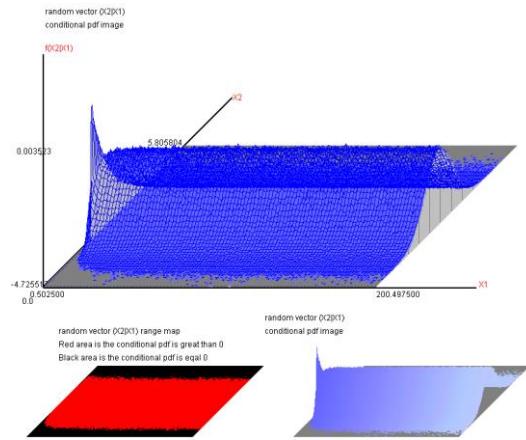

number=1,000,000,000, the shape of $f(X2|X1)$ can show the sample size effect.

The skewed coefficient will move away from 0 when $|\lambda - 0.5|$ is increased. The sample size is increasing if test statistic approaching standard normal distribution.

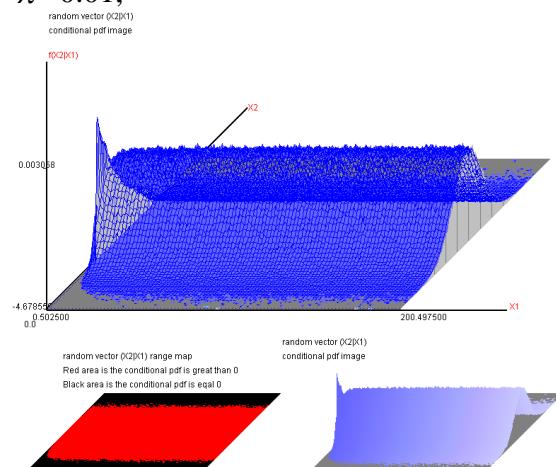

$$\lambda = 0.01,$$

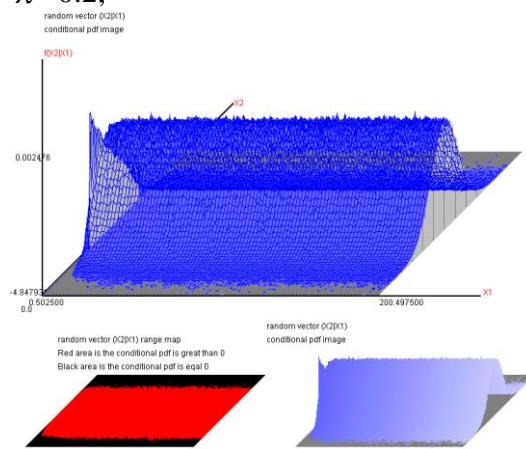

$$\lambda = 0.05,$$

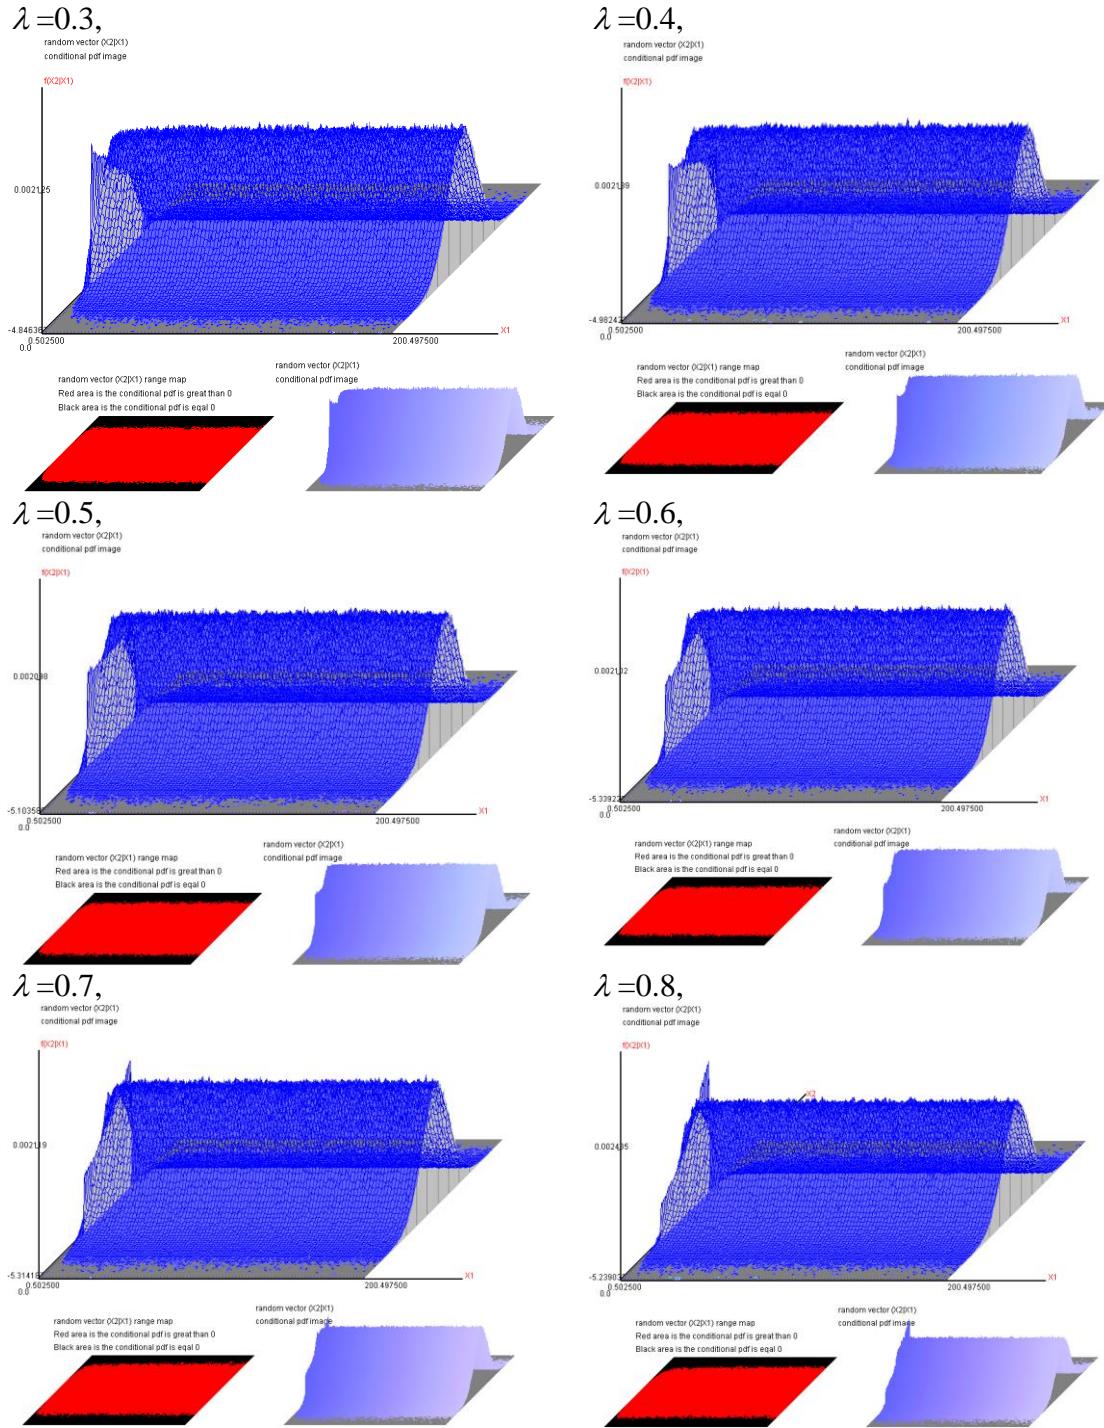

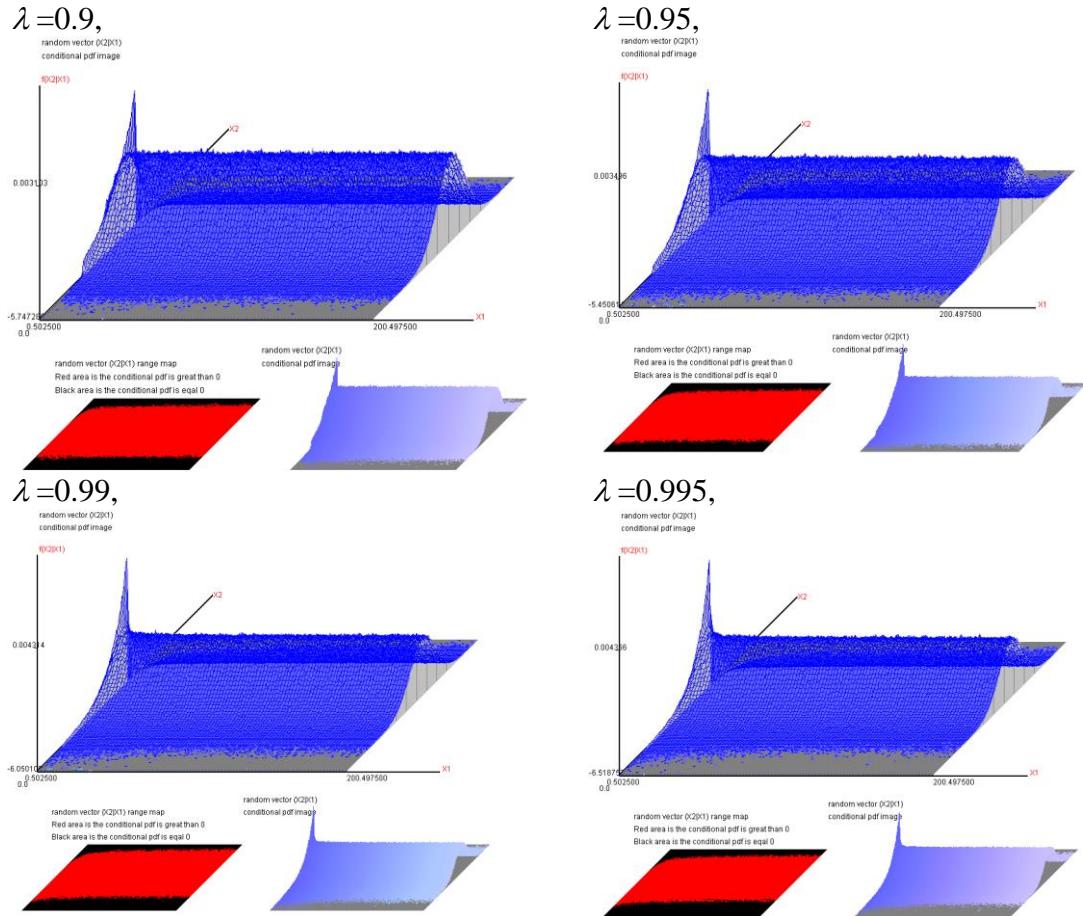

$$\lambda = 0.01,$$

$$\lambda = 0.2,$$

Section 4, The parameter λ test statistic when $X_1, X_2, \dots, X_n \stackrel{iid}{\sim} CB(\lambda)$,

(1) The Z test statistic for large sample,

$$n \geq 6 + 250 \times |\lambda - 0.5|, \text{ if } 0.1 \leq \lambda \leq 0.9,$$

$$n \geq 100 + 2000 \times (\lambda - 0.1), \text{ if } \lambda < 0.1,$$

$$n \geq 100 + 2000 \times (\lambda - 0.9), \text{ if } \lambda > 0.9,$$

$$\frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)} \xrightarrow{\text{Normal}} \text{Normal}(0,1),$$

$$H_0: \lambda = c \quad H_1: \lambda \neq c,$$

$$Z^* = \frac{\bar{X} - G_1(c)}{\sqrt{\frac{G_2(c)}{n}}} \rightarrow Z \sim \text{Normal}(0,1), |Z^*| > Z_{\alpha/2} \text{ rejected } H_0 \text{ and } P(Z > Z_{\alpha/2}) = \frac{\alpha}{2}.$$

$G_1(\lambda)$ is $E(X)$ estimated equation and $G_2(\lambda)$ is $Var(X)$ estimated equation.

$G_1(\lambda)$ and $G_2(\lambda)$ please see chapter 1, section 3.

The test statistic distribution to computing the $P(H_1 | H_0)$,

$\text{pr}(1-\alpha) = P(\text{doesn't rejected } H_1 | H_0: \lambda = \lambda_0) = 1 - \alpha$, $\alpha = \text{significant}$

level=0.1,0.05,0.01 and $\text{pr}(1-\alpha) = (\text{the times right test result})/100,000$, each probability is from 100,000 times simulated and each time simulated data is the sample size. The simulated data is from Continuous Bernoulli(λ) simulator.

(2) The test statistic sampling distribution from simulator for small sample,

$$n < 6 + 250 \times |\lambda - 0.5|, \text{ if } 0.1 \leq \lambda \leq 0.9,$$

$$n < 100 + 2000 \times (\lambda - 0.1), \text{ if } \lambda < 0.1,$$

$$n < 100 + 2000 \times (\lambda - 0.9), \text{ if } \lambda > 0.9,$$

The critical value of test statistic is computed by the simulated sampling distribution

$$\text{of } \frac{\sqrt{n}(\bar{X} - \mu(X))}{\sigma(X)}.$$

$$H_0: \lambda = c \quad H_0: \lambda = c, \text{ the test statistic value} = \frac{\bar{X} - G_1(c)}{\sqrt{\frac{G_2(c)}{n}}},$$

$G_1(\lambda)$ is $E(X)$ estimated equation and $G_2(\lambda)$ is $Var(X)$ estimated equation.

(2-4) The test statistic distribution to computing the $P(H_0 | H_0)$,

$\text{pr}(1-\alpha) = P(\text{doesn't rejected } H_0 | H_0: \lambda = \lambda_0) = 1 - \alpha$, $\alpha = \text{significant}$

level=0.1, 0.05, 0.01 and $\text{pr}(1-\alpha) = (\text{the times right test result})/100,000$, each probability is from 100,000 times simulated and each time simulated data is the sample size. The simulated data is from Continuous Bernoulli(λ) simulator.

Note: The computer program is C:\C_Bernoulli\C_Bernoulli_05.exe, which is the testing of λ when population is Continuous Bernoulli population.

Chapter 5, The confidence interval of Continuous Bernoulli distribution

$$\text{The statistic} = \frac{\sqrt{n}(\bar{X} - \mu(X))}{S(X)}, \bar{X} = \frac{\sum_{i=1}^n X_i}{n}, S(X) = \sqrt{\frac{\sum_{i=1}^n (X_i - \bar{X})^2}{n-1}}, E(X), \text{Var}(X)$$

cannot get the value when λ is unknown, the statistic could infer the confidence

$$\text{interval of } \lambda. \quad \frac{\sqrt{n}(\bar{X} - \mu(X))}{S(X)} \xrightarrow{n \geq n(\bar{X})} \text{Normal}(0,1).$$

The sample size must very large when this statistic approaching standard normal distribution, because the λ is shape parameter. The exception of this statistic is not 0 and variance is not 1 when λ is not 0.5. The sample size is infinite, the exception is 0 and variance is 1.

$$\text{Section 1, } n(\bar{X}) = ? \quad \mathbf{W17} = \frac{\sqrt{n}(\bar{X} - \mu(X))}{S(X)} \xrightarrow{n \geq n(\bar{X})} \text{Normal}(0,1),$$

Getting the simulated data of W17 and standard normal distribution using the simulator and the simulated data number=100,000,000.

Calculating the $n(\bar{X})$ using the Strong Law of Large Number, the requirement is

$$P\{F_{W17}(W17) - \Phi(W17) < 0.1\} = 1, P\{F_{W17}(W17) - \Phi(W17) < 0.05\} = 1,$$

$$P\{F_{W17}(W17) - \Phi(W17) < 0.01\} = 1, P\{F_{W17}(W17) - \Phi(W17) < 0.005\} = 1,$$

$$\text{when } \frac{\sqrt{n}(\bar{X} - \mu(X))}{S(X)} \xrightarrow{n \geq n(\bar{X})} \text{Normal}(0,1).$$

$$\Phi(z) = P(Z \leq z) = \int_{-\infty}^z \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{z^2}{2}\right) dz \quad \text{is the distribution function of standard}$$

normal distribution.

$$(1-1) \lambda = 0.01, n(\bar{X}) = 2000,$$

Section 3, $f\left(\frac{\sqrt{n}(\bar{X} - \mu(X))}{S(X)}\right)$ | n=sample size),

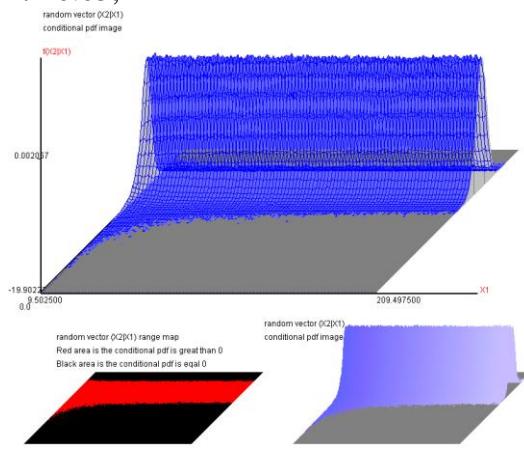

$X2 = \frac{\sqrt{n}(\bar{X} - \mu(X))}{S(X)}$ and $X1 = n = \text{sample size}$, $n = 10, 11, 12, \dots, 208, 209$, the simulated

data number = 1,000,000,000, the shape of $f(X2|X1)$ can show the sample size effect. The λ is more far from 0.5 and the skewed coefficient of this statistic is more far from 0 when sample size is small. The statistic will be approaching to the symmetric when n is very large. The following each diagram two tailed probabilities are removing 0.00001.

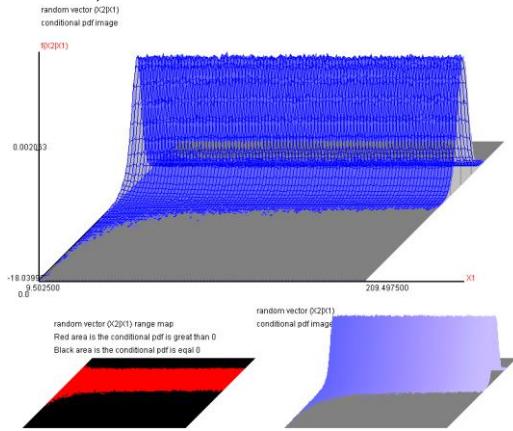

$\lambda = 0.01$,

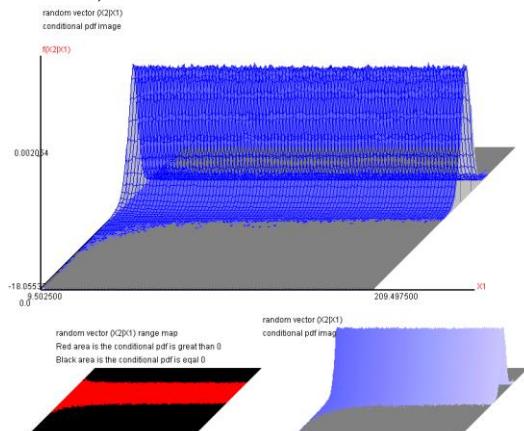

$\lambda = 0.05$,

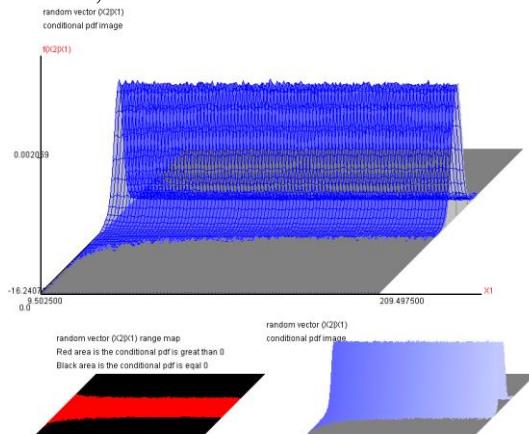

$\lambda = 0.1$,

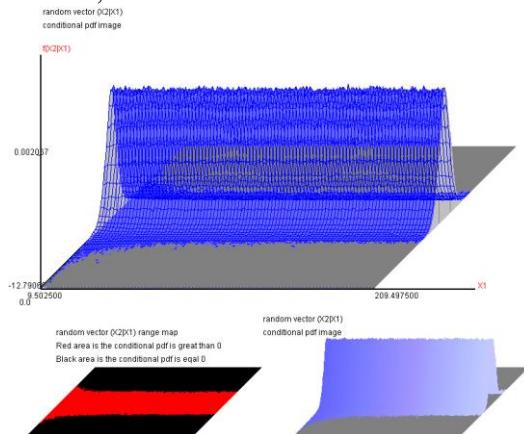

$\lambda = 0.2$,

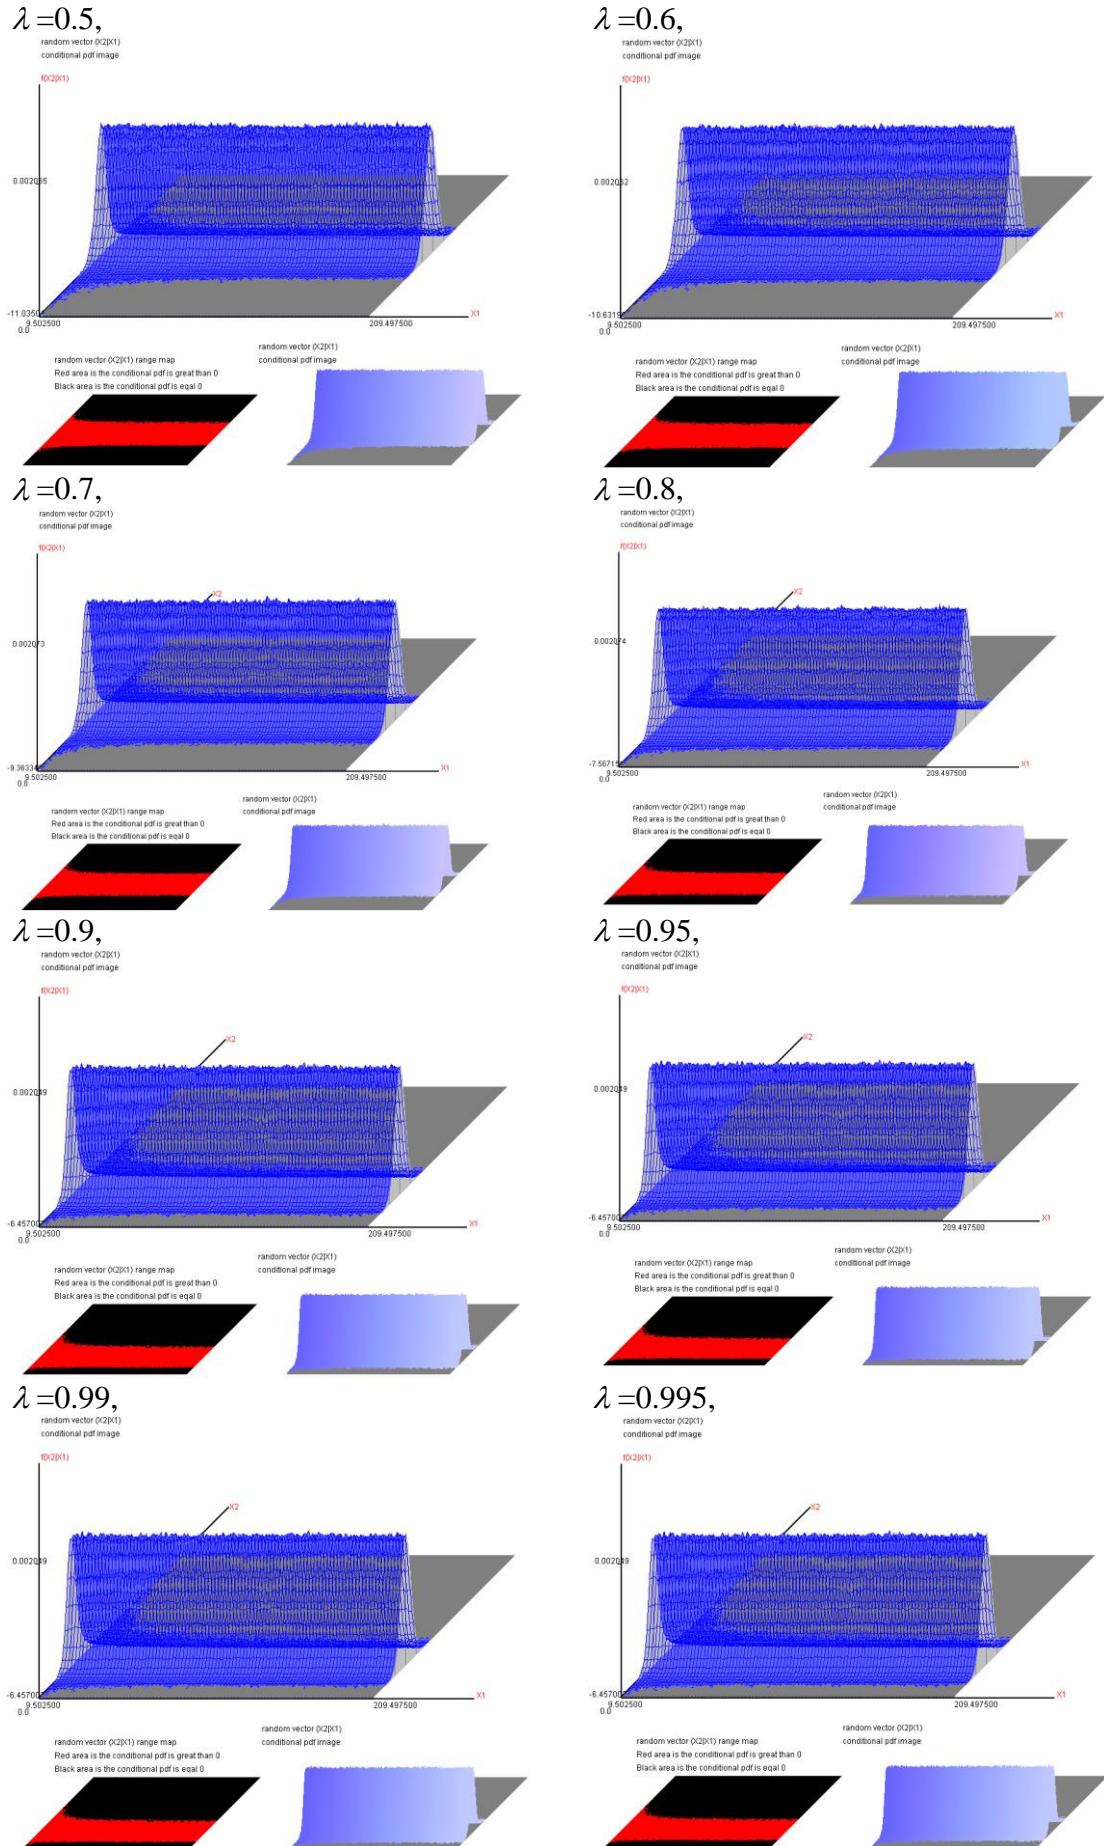

$\lambda = 0.3$,

$\lambda = 0.4$,

Section 4, The Confidence interval of λ ,

(1) The confidence interval of λ for large sample,

The sample size is affected by the λ when this statistic approaching standard normal distribution.

$$\hat{\lambda} = \phi(\bar{X}), 0.143853919 \leq \bar{X} \leq 0.856221427 \text{ and } 0.001 \leq \hat{\lambda} \leq 0.999.$$

$$n \geq 33 + 350 \times |\hat{\lambda} - \phi(\bar{X}) - 0.5|, \text{ if } 0.1 \leq \hat{\lambda} \leq 0.9,$$

$$n \geq 500 + 15000 \times (0.1 - \hat{\lambda} = \phi(\bar{X})), \text{ if } \hat{\lambda} = \phi(\bar{X}) < 0.1,$$

$$n \geq 500 + 15000 \times (\hat{\lambda} = \phi(\bar{X}) - 0.9), \text{ if } \hat{\lambda} = \phi(\bar{X}) > 0.9,$$

$$\frac{(\bar{X} - \mu(X))}{S(\bar{X})} \xrightarrow{\text{Normal}(0,1)}, \bar{X} = \frac{\sum_{i=1}^n X_i}{n}, S(X) = \sqrt{\frac{\sum_{i=1}^n (X_i - \bar{X})^2}{n-1}}, S(\bar{X}) = \frac{S(X)}{\sqrt{n}},$$

$$(1-\alpha) \times 100\% \text{ C.I. for } E(\bar{X}) = \mu$$

$$\bar{X} - Z_{\alpha/2} \times S(\bar{X}) \leq \mu \leq \bar{X} + Z_{\alpha/2} \sqrt{S^2(\bar{X})},$$

$$P(Z > Z_\alpha) = \alpha, \quad Z \text{ is the standard normal distribution,}$$

$$(1-\alpha) \times 100\% \text{ C.I. for } \lambda$$

$$\phi(\bar{X} - Z_{\alpha/2} \times S(\bar{X})) \leq \lambda \leq \phi(\bar{X} + Z_{\alpha/2} \times S(\bar{X}))$$

Checking the right probability when the C.I. for λ at the confidence interval, computing the right probability of confirming and the simulated times is changed to 1,000,000 for the accurate when using Z distribution to do confidence interval.

P(C.I. containing λ) = $1 - \alpha$, the C.I. is the confidence interval of λ at $1 - \alpha$, $\alpha = 0.1, 0.05, 0.01$.

(1-1) The λ is continuous bernoulli parameter value and computing the sample size requirement for CLT,

$$n \geq 33 + 350 \times |\lambda - 0.5|, \text{ if } 0.1 \leq \lambda \leq 0.9,$$

$$n \geq 500 + 15000 \times (0.1 - \lambda), \text{ if } \lambda < 0.1,$$

$$n \geq 500 + 15000 \times (\lambda - 0.9), \text{ if } \lambda > 0.9,$$

(1-2) The computing the sample size by $\hat{\lambda} = \phi(\bar{X})$,

The confidence interval is from Z distribution when the sample size is large sample and the confidence interval is from sampling distribution of \bar{X} when sample size is small sample.

$\hat{\lambda} = \phi(\bar{X})$, $0.143853919 \leq \bar{X} \leq 0.856221427$ and $0.001 \leq \hat{\lambda} \leq 0.999$.

The large sample is $n \geq 33 + 350 \times |\hat{\lambda} - \phi(\bar{X}) - 0.5|$, if $0.1 \leq \hat{\lambda} \leq 0.9$,

$n \geq 500 + 15000 \times (0.1 - \hat{\lambda} = \phi(\bar{X}))$, if $\hat{\lambda} = \phi(\bar{X}) < 0.1$,

$n \geq 500 + 15000 \times (\hat{\lambda} = \phi(\bar{X}) - 0.9)$, if $\hat{\lambda} = \phi(\bar{X}) > 0.9$,

(*) is the part of confidence interval critical value is used to the sampling distribution, part is from the standard normal distribution.

(2)The small sample,

$$n < 33 + 350 \times |\hat{\lambda} - \phi(\bar{X}) - 0.5|, \text{ if } 0.1 \leq \hat{\lambda} \leq 0.9,$$

$$n < 500 + 15000 \times (0.1 - \hat{\lambda} = \phi(\bar{X})), \text{ if } \hat{\lambda} = \phi(\bar{X}) < 0.1,$$

$$n < 500 + 15000 \times (\hat{\lambda} = \phi(\bar{X}) - 0.9), \text{ if } \hat{\lambda} = \phi(\bar{X}) > 0.9,$$

$$(1-\alpha) \times 100\% \text{ C.I. for } E(\bar{X}) = \mu$$

$$\bar{X} - W_{\alpha/2} \times S(\bar{X}) \leq \mu \leq \bar{X} + W_{\alpha/2} \sqrt{S^2(\bar{X})},$$

$$P(W > W_\alpha) = \alpha, \quad W \text{ is the sampling distribution of } \frac{(\bar{X} - \mu(X))}{S(\bar{X})} \text{ which can be}$$

simulated using the continuous bernoulli distribution simulator. The λ and sample size will be a specific sampling distribution, the software computing critical value is a essentially way.

Warning:

Because the sample size too small that $\hat{\lambda} = \phi(\bar{X})$ might be not used when \bar{X} is not in [0.143853919, 0.856221427], the minimum sample number requirement as follows.
The simulated times=100,000, $\hat{\lambda} = \phi(\bar{X})$ cannot work which is “error”.

$$\lambda = 0.01, n \geq 270, P(\text{error}) = 0.001098,$$

$$\lambda = 0.1, n \geq 55, P(\text{error}) = 0.001420,$$

$$\lambda = 0.2, n \geq 38, P(\text{error}) = 0.001198,$$

$$\lambda = 0.3, n \geq 30, P(\text{error}) = 0.001250,$$

$$\lambda = 0.4, n \geq 25, P(\text{error}) = 0.001296,$$

$$\lambda = 0.5, n \geq 22, P(\text{error}) = 0.001613,$$

$$\lambda = 0.6, n \geq 25, P(\text{error}) = 0.001289,$$

$$\lambda = 0.7, n \geq 30, P(\text{error}) = 0.001238,$$

$$\lambda = 0.8, n \geq 38, P(\text{error}) = 0.001119,$$

$$\lambda = 0.9, n \geq 55, P(\text{error}) = 0.001425,$$

$$\lambda = 0.99, n \geq 260, P(\text{error}) = 0.001399,$$

Note: The computer program is C:\C_Bernoulli\C_Bernoulli_6.exe.

Chapter 6, The test statistic and confidence interval of two Continuous Bernoulli populations,

The test statistic is about two independent continuous Bernoulli populations $\mu_1 - \mu_2$ and inferring to $\lambda_1 - \lambda_2$, which is in according to the chapter 5 and chapter 6.

$$X_{1,1}, X_{1,2}, \dots, X_{1,n_1} \stackrel{iid}{\sim} CB(\lambda_1), \bar{X}_1 = \frac{\sum_{i=1}^{n_1} X_{1,i}}{n_1}, S_1 = \sqrt{\frac{\sum_{i=1}^{n_1} (X_{1,i} - \bar{X}_1)^2}{n_1 - 1}},$$

$\mu_1 = G_1(\lambda_1)$, ($G_1(\cdot)$, chapter 1, section 3).

$$X_{2,1}, X_{2,2}, \dots, X_{2,n_2} \stackrel{iid}{\sim} CB(\lambda_2), \bar{X}_2 = \frac{\sum_{j=1}^{n_2} X_{2,j}}{n_2}, S_2 = \sqrt{\frac{\sum_{j=1}^{n_2} (X_{2,j} - \bar{X}_2)^2}{n_2 - 1}},$$

$\mu_2 = G_2(\lambda_2)$, ($G_2(\cdot)$, chapter 1, section 3).

Section 1, The test statistic of $H_0: \mu_1 = \mu_2 + c, c \neq 0$,

λ_1 and λ_2 are unknown, $\hat{\lambda}_1 = \phi(\bar{X}_1)$, $\hat{\lambda}_2 = \phi(\bar{X}_2)$, and $\lambda_1 = \phi(\mu_1)$, $\lambda_2 = \phi(\mu_2)$. ($\phi(\cdot)$, chapter 3, section 3).

If $\mu_1 \neq \mu_2$, $\lambda_1 \neq \lambda_2$,

$$\text{the test statistic} = \frac{\bar{X}_1 - \bar{X}_2 - (\mu_1 - \mu_2)}{\sqrt{\frac{S_1^2}{n_1} + \frac{S_2^2}{n_2}}}$$

(1) The large sample,

$$\hat{\lambda}_1 = \phi(\bar{X}_1), 0.143853919 \leq \bar{X}_1 \leq 0.856221427 \text{ and } 0.001 \leq \hat{\lambda}_1 \leq 0.999.$$

The large sample is $n_1 \geq 33 + 350 \times |\hat{\lambda}_1 - 0.5|$, if $0.1 \leq \hat{\lambda}_1 \leq 0.9$,

$$n_1 \geq 500 + 15000 \times (0.1 - \hat{\lambda}_1), \text{ if } \hat{\lambda}_1 < 0.1,$$

$$n_1 \geq 500 + 15000 \times (\hat{\lambda}_1 - 0.9), \text{ if } \hat{\lambda}_1 > 0.9,$$

and

$$\hat{\lambda}_2 = \phi(\bar{X}_2), 0.143853919 \leq \bar{X}_2 \leq 0.856221427 \text{ and } 0.001 \leq \hat{\lambda}_2 \leq 0.999.$$

The large sample is $n_2 \geq 33 + 350 \times |\hat{\lambda}_2 - 0.5|$, if $0.1 \leq \hat{\lambda}_2 \leq 0.9$,

$$n_2 \geq 500 + 15000 \times (0.1 - \hat{\lambda}_2), \text{ if } \hat{\lambda}_2 < 0.1,$$

$$n_2 \geq 500 + 15000 \times (\hat{\lambda}_2 - 0.9), \text{ if } \hat{\lambda}_2 > 0.9,$$

$$H_0: \mu_1 = \mu_2 + c, c \neq 0,$$

$$Z^* = \frac{\bar{X}_1 - \bar{X}_2 - c}{\sqrt{\frac{S_1^2}{n_1} + \frac{S_2^2}{n_2}}} \xrightarrow{\text{standard normal distribution}},$$

$Z^* > Z_{\alpha/2}$, H_0 is rejected.

$$\text{p value} = 2 \times P(Z \leq Z^*), \text{ if } P(Z \leq Z^*) < 0.5$$

$$\text{p value} = 2 \times (1 - P(Z \leq Z^*)), \text{ if } P(Z \leq Z^*) \geq 0.5$$

(2) The small sample,

$$\hat{\lambda}_1 = \phi(\bar{X}_1), 0.143853919 \leq \bar{X}_1 \leq 0.856221427 \text{ and } 0.001 \leq \hat{\lambda}_1 \leq 0.999.$$

The large sample is $n_1 < 33 + 350 \times |\hat{\lambda}_1 - 0.5|$, if $0.1 \leq \hat{\lambda}_1 \leq 0.9$,

$$n_1 < 500 + 15000 \times (0.1 - \hat{\lambda}_1), \text{ if } \hat{\lambda}_1 < 0.1,$$

$$n_1 < 500 + 15000 \times (\hat{\lambda}_1 - 0.9), \text{ if } \hat{\lambda}_1 > 0.9,$$

or

Chapter 8, One way analysis when population is Continuous Bernoulli distribution

Section 1, The one way analysis,

There are k independent Continuous Bernoulli distributions, the random samples from each population and the same size.

$$\begin{aligned} X_{1,1}, X_{1,2}, \dots, X_{1,n} &\stackrel{iid}{\sim} CB(\lambda_1), \\ X_{2,1}, X_{2,2}, \dots, X_{2,n} &\stackrel{iid}{\sim} CB(\lambda_2), \\ \dots &\\ X_{k,1}, X_{k,2}, \dots, X_{k,n} &\stackrel{iid}{\sim} CB(\lambda_k), \\ X_{i,j} &= \mu + \alpha_i + \varepsilon_{ij}, i=1,2,\dots,k, j=1,2,\dots,n, \end{aligned}$$

$$\begin{aligned} X_{1,1}, X_{1,2}, \dots, X_{1,n} &\stackrel{iid}{\sim} CB(\lambda_1), \\ X_{2,1}, X_{2,2}, \dots, X_{2,n} &\stackrel{iid}{\sim} CB(\lambda_2), \\ \dots &\\ X_{k,1}, X_{k,2}, \dots, X_{k,n} &\stackrel{iid}{\sim} CB(\lambda_k), \\ X_{i,j} &= \mu + \alpha_i + \varepsilon_{ij}, i=1,2,\dots,k, j=1,2,\dots,n, \\ X_{i,j} &\sim CB(E(X_{ij})), E(X_{ij}) = \mu_i = \mu + \alpha_i = G_1(\lambda_i), i=1,2,\dots,k, \\ H_0 : \lambda_1 &= \lambda_2 = \dots = \lambda_k, (\mu_1 = \mu_2 = \dots = \mu_k = \mu), (\alpha_1 = \alpha_2 = \dots = \alpha_k = 0), \end{aligned}$$

$$\begin{aligned} \bar{X}_i &= \frac{\sum_{j=1}^n X_{i,j}}{n}, S_i^2 = \frac{\sum_{j=1}^n (X_{i,j} - \bar{X}_i)^2}{n-1}, i=1,2,\dots,k, \\ \bar{X} &= \frac{\sum_{i=1}^k \sum_{j=1}^n X_{i,j}}{n_T}, n_T = n \times k, \end{aligned}$$

$$\begin{aligned} SST &= \sum_{i=1}^k \sum_{j=1}^n (X_{i,j} - \bar{X})^2 = \sum_{i=1}^k \sum_{j=1}^n (X_{i,j} - \bar{X}_i + \bar{X}_i - \bar{X})^2 \\ &= \sum_{i=1}^k \sum_{j=1}^n (X_{i,j} - \bar{X}_i)^2 + \sum_{i=1}^k \sum_{j=1}^n (\bar{X}_i - \bar{X})^2, \\ SSTR &= \sum_{i=1}^k \sum_{j=1}^n (\bar{X}_i - \bar{X})^2, SSE = \sum_{i=1}^k \sum_{j=1}^n (X_{i,j} - \bar{X}_i)^2, \end{aligned}$$

SST degree of freedom = $n_T - 1$, SSTR degree of freedom = $k - 1$,

SSE degree of free = $n_T - k$, MSTR = SSTR/(k-1), MSE = SSE/(n_T - k).

Section 2, ANOVA and test statistic,

ANOVA

Source	SS	df	MS
Treatment	SSTR	k-1	MSTR=SSTR/(k-1)
Error	SSE	$n_T - k$	$MSE = SSE / (n_T - k)$
C Total	SST	$n_T - 1$	

The test statistic=MSTR/MSE and the rejected region is the right region.

The p value=P(MSTR/MSE>W), p value< α , rejected H0.

W~MSTR/MSE probability distribution.

the sampling distribution of W will be simulated using the probability simulator and the simulated data is based on

$$\begin{aligned}
 X_{2,1}, X_{2,2}, \dots, X_{2,n} &\stackrel{iid}{\sim} CB(\hat{\lambda}), \hat{\lambda} = \phi(\bar{\bar{X}}), \\
 X_{2,1}, X_{2,2}, \dots, X_{2,n} &\stackrel{iid}{\sim} CB(\hat{\lambda}), \dots, \\
 X_{k,1}, X_{k,2}, \dots, X_{k,n} &\stackrel{iid}{\sim} CB(\hat{\lambda}), \\
 SST &= \sum_{i=1}^k \sum_{j=1}^n (X_{i,j} - \bar{\bar{X}})^2 = \sum_{i=1}^k \sum_{j=1}^n (X_{i,j} - \bar{X}_i + \bar{X}_i - \bar{\bar{X}})^2 \\
 &= \sum_{i=1}^k \sum_{j=1}^n (X_{i,j} - \bar{X}_i)^2 + \sum_{i=1}^k \sum_{j=1}^n (\bar{X}_i - \bar{\bar{X}})^2, \\
 SSTR &= \sum_{i=1}^k \sum_{j=1}^n (\bar{X}_i - \bar{\bar{X}})^2, SSE = \sum_{i=1}^k \sum_{j=1}^n (X_{i,j} - \bar{X}_i)^2, W = \frac{MSTR}{MSE}
 \end{aligned}$$

Section 3, The sampling distribution of MSTR/MSE,

Let W1= MSTR/MSE,

$$(3-1) \quad H_0 : \lambda_1 = \lambda_2 = \dots = \lambda_k = 0.2,$$

$$(3-1-1) k=3, \quad H_0 : \lambda_1 = \lambda_2 = \dots = \lambda_k = 0.2, \quad n=5,$$

The right tailed probability is removing 0.01,

Chapter 9, The Continuous Trinomial distribution and trial number=1,

The trinomial distribution and trial number=1,

$$f_{X_1, X_2}(x_1, x_2; p_1, p_2) = p_1^{x_1} p_2^{x_2} (1 - p_1 - p_2)^{1-x_1-x_2}, \quad x_1 = 0, 1, x_2 = 0, 1, x_1 + x_2 = 0, 1,$$

$$0 < p_1 < 1, 0 < p_2 < 1,$$

analysis by Bayesian Theorem,

$$P(X_1 = 1) = p_1 \quad \begin{aligned} P(X_2 = 0 | X_1 = 1) &= 1, \\ P(X_2 = 1 | X_1 = 1) &= 0, \end{aligned}$$

$$P(X_1 = 0) = 1 - p_1 \quad \begin{aligned} P(X_2 = 0 | X_1 = 0) &= 1 - \frac{p_2}{1 - p_1}, \\ P(X_2 = 1 | X_1 = 0) &= \frac{p_2}{1 - p_1}, \end{aligned}$$

$$P(X_1 = 0, X_2 = 0) = p_1, \quad P(X_1 = 0, X_2 = 1) = p_2, \quad P(X_1 = 0, X_2 = 0) = (1 - p_1 - p_2),$$

\Rightarrow

$$P(X_2 = 1) = p_2 \quad \begin{aligned} P(X_1 = 0 | X_2 = 1) &= 1, \\ P(X_1 = 1 | X_2 = 1) &= 0, \end{aligned}$$

$$P(X_2 = 0) = 1 - p_2 \quad \begin{aligned} P(X_1 = 0 | X_2 = 0) &= 1 - \frac{p_1}{1 - p_2}, \\ P(X_1 = 1 | X_2 = 0) &= \frac{p_1}{1 - p_2}, \end{aligned}$$

$$X_1 \sim \text{Bernoulli}(p_1), \quad X_2 \sim \text{Bernoulli}(p_2), \quad 1 - X_1 - X_2 \sim \text{Bernoulli}(1 - p_1 - p_2),$$

$$X_1 + X_2 \sim \text{Bernoulli}(p_1 + p_2),$$

X_1 and X_2 are discrete random variables,

Let X_1 and X_2 be continuous random variables and $p_1 = \lambda_1$, $p_2 = \lambda_2$ to find the Continuous Trinomial distribution and trial number=1,

$$f_{X_1, X_2}(x_1, x_2; \lambda_1, \lambda_2) = C(\lambda_1, \lambda_2) \lambda_1^{x_1} \lambda_2^{x_2} (1 - \lambda_1 - \lambda_2)^{1-x_1-x_2},$$

$$0 < x_1 < 1, 0 < x_2 < 1, 0 < x_1 + x_2 < 1, 0 < \lambda_1 < 1, 0 < \lambda_2 < 1, 0 < \lambda_1 + \lambda_2 < 1,$$

Section 1, Setting $X_1 \sim \text{Continuous Bernoulli}(\lambda_1)$, $X_2 \sim \text{Continuous Bernoulli}(\lambda_2)$
to find the $f_{X_1, X_2}(x_1, x_2; \lambda_1, \lambda_2)$,

$$f_{X_1}(x_1; \lambda_1) = C(\lambda_1) \lambda_1^{x_1} (1 - \lambda_1)^{1-x_1}, 0 < x_1 < 1, 0 < \lambda_1 < 1,$$

$$f_{X_2}(x_2; \lambda_2) = C(\lambda_2) \lambda_2^{x_2} (1 - \lambda_2)^{1-x_2}, 0 < x_2 < 1, 0 < \lambda_2 < 1,$$

$$C(\lambda_i) = \begin{cases} \frac{2 \tanh^{-1}(1-2\lambda_i)}{1-2\lambda}, & \lambda_i \neq \frac{1}{2}, i=1,2, \\ 2, & \lambda_i = \frac{1}{2} \end{cases}$$

Getting the $f_{X_1}(x_1; \lambda_1)$ from joint probability density function of (x_1, x_2)

$$\begin{aligned} f_{X_1}(x_1; \lambda_1) &= \int_0^{1-x_1} C(\lambda_1, \lambda_2) \lambda_1^{x_1} \lambda_2^{x_2} (1 - \lambda_1 - \lambda_2)^{1-x_1-x_2} dx_2, \\ &= C(\lambda_1) \lambda_1^{x_1} (1 - \lambda_1)^{1-x_1} \int_0^{1-x_1} \frac{C(\lambda_1, \lambda_2)}{C(\lambda_1)} \left(\frac{\lambda_2}{1 - \lambda_1} \right)^{x_2} \left(1 - \frac{\lambda_2}{1 - \lambda_1} \right)^{1-x_1-x_2} dx_2, \\ &\lambda = \frac{\lambda_2}{1 - \lambda_1}, \int_0^{1-x_1} \left(\frac{\lambda_2}{1 - \lambda_1} \right)^{x_2} \left(1 - \frac{\lambda_2}{1 - \lambda_1} \right)^{1-x_1-x_2} dx_2 = \int_0^{1-x_1} \lambda^{x_2} (1 - \lambda)^{1-x_1-x_2} dx_2 \quad \dots \quad (9.1) \end{aligned}$$

$$w = \frac{x_2}{1 - x_1}, \frac{dx_2}{dw} = 1 - x_1, 0 < w < 1,$$

$$\begin{aligned} (9.1) \Rightarrow \int_0^1 \lambda^{(1-x_1)w} (1 - \lambda)^{1-x_1-(1-x_1)w} (1 - x_1) dw &= (1 - x_1) \int_0^1 \lambda^{(1-x_1)w} (1 - \lambda)^{(1-x_1)(1-w)} (1 - x_1) dw \\ &= (1 - x_1) \int_0^1 \lambda^{(1-x_1)w} (1 - \lambda)^{(1-x_1)(1-w)} dw = (1 - x_1) (1 - \lambda)^{1-x_1} \int_0^1 \left(\frac{\lambda}{1 - \lambda} \right)^{(1-x_1)w} dw \\ &= (1 - x_1) (1 - \lambda)^{1-x_1} \int_0^1 \exp \left((1 - x_1)w \times \log \left(\left(\frac{\lambda}{1 - \lambda} \right) \right) \right) dw \\ &= (1 - x_1) (1 - \lambda)^{1-x_1} \times \frac{\exp \left((1 - x_1) \times \log \left(\left(\frac{\lambda}{1 - \lambda} \right) \right) \right) - 1}{(1 - x_1) \times \log \left(\left(\frac{\lambda}{1 - \lambda} \right) \right)} \\ &= (1 - x_1) (1 - \lambda)^{1-x_1} \times \frac{\left(\frac{\lambda}{1 - \lambda} \right)^{1-x_1} - 1}{(1 - x_1) \times (\log(\lambda) - \log(1 - \lambda))} \\ &= \frac{(\lambda)^{1-x_1} - (1 - \lambda)^{1-x_1}}{(\log(\lambda) - \log(1 - \lambda))}, \lambda \neq 0.5 \end{aligned}$$

$$(1) f_{X_1, X_2}(x_1, x_2; \lambda_1, \lambda_2) = f_{X_1}(x_1; \lambda_1) f_{X_2|x_1}(x_2|x_1)$$

$$\lambda = \frac{\lambda_2}{1-\lambda_1} \neq 0.5,$$

$X_2 \sim \text{Continuous Bernoulli } (\lambda_2)$, X_1 is not Continuous Bernoulli(λ_1),

(3) Conclusion,

$$f_{X_2}(x_2; \lambda_2) f_{X_1|X_2}(x_1|x_2) \neq f_{X_1}(x_1; \lambda_1) f_{X_2|X_1}(x_2|x_1),$$

$f_{X_2}(x_2; \lambda_2) f_{X_1|X_2}(x_1|x_2)$ and $f_{X_1}(x_1; \lambda_1) f_{X_2|X_1}(x_2|x_1)$ do not have the property of joint probability density function.

The requirement of $X_1 \sim \text{Continuous Bernoulli}(\lambda_1)$ and $X_2 \sim \text{Continuous Bernoulli}(\lambda_2)$ cannot derive the joint probability density function $f_{X_1, X_2}(x_1, x_2; \lambda_1, \lambda_2)$.

Section 2, Following property of joint probability density function,

$$f_{X_1, X_2}(x_1, x_2; \lambda_1, \lambda_2) = C(\lambda_1, \lambda_2) \lambda_1^{x_1} \lambda_2^{x_2} (1 - \lambda_1 - \lambda_2)^{1-x_1-x_2},$$

$$0 < x_1 < 1, 0 < x_2 < 1, 0 < x_1 + x_2 < 1, 0 < \lambda_1 < 1, 0 < \lambda_2 < 1, 0 < \lambda_1 + \lambda_2 < 1,$$

$$1. \quad C(\lambda_1, \lambda_2) = ?$$

Chapter 10, The Continuous Trinomial distribution and trial number=n,

Section 1, The joint probability density function,

The function setting,

$$f_{X_1, X_2}(x_1, x_2; \lambda_1, \lambda_2) = C(n, \lambda_1, \lambda_2) \lambda_1^{x_1} \lambda_2^{x_2} (1 - \lambda_1 - \lambda_2)^{n-x_1-x_2},$$

$$0 < x_1 < n, 0 < x_2 < n, 0 < x_1 + x_2 < n, 0 < \lambda_1 < 1, 0 < \lambda_2 < 1, 0 < \lambda_1 + \lambda_2 < 1,$$

$$f_{X_1}(x_1; n, \lambda_1, \lambda_2) = \int_0^{n-x_1} C(n, \lambda_1, \lambda_2) \lambda_1^{x_1} \lambda_2^{x_2} (1 - \lambda_1 - \lambda_2)^{n-x_1-x_2} dx_2,$$

$$f_{X_2}(x_2; n, \lambda_1, \lambda_2) = \int_0^{n-x_2} C(n, \lambda_1, \lambda_2) \lambda_1^{x_1} \lambda_2^{x_2} (1 - \lambda_1 - \lambda_2)^{n-x_1-x_2} dx_1,$$

$$f_{X_2|x_1}(x_2|x_1) = \frac{\lambda_1^{x_1} \lambda_2^{x_2} (1 - \lambda_1 - \lambda_2)^{n-x_1-x_2}}{\int_0^{n-x_1} \lambda_2^{x_2} (1 - \lambda_1 - \lambda_2)^{n-x_1-x_2} dx_2}, 0 \leq x_2 \leq n - x_1,$$

$$f_{X_1|x_2}(x_1|x_2) = \frac{\lambda_1^{x_1} (1 - \lambda_1 - \lambda_2)^{n-x_1-x_2}}{\int_0^{n-x_2} \lambda_1^{x_1} (1 - \lambda_1 - \lambda_2)^{n-x_1-x_2} dx_1}, 0 \leq x_1 \leq n - x_2,$$

$C(n, \lambda_1, \lambda_2)$ could be computed using numerical analysis only.

The marginal probability distributions of X_1 and X_2 are not the continuous binomial distribution.

Section 2, The simulation method,

(1)The simulator,

The joint probability density function can not be found using transformation, but the probability distribution simulator can compute this function.

The method is

$(X_{1,1}, X_{2,1}), (X_{1,2}, X_{2,2}), \dots, (X_{1,n}, X_{2,n})$ are independent paired random variables,

$(X_{1,i}, X_{2,i}) \sim$ Continuous trinomial distribution (λ_1, λ_2) and trial number=1,

$i = 1, 2, \dots, n$.

Let $X_1 = \sum_{i=1}^n X_{1,i}$, $X_2 = \sum_{i=1}^n X_{2,i}$,

$(X_1, X_2) \sim$ Continuous trinomial distribution (λ_1, λ_2) and trial number=n.

The simulated process,

(i) Getting the database of $(X_{1,1}, X_{2,1})$ using the numerical analysis and random number simulator. [$(X_{1,1}, X_{2,1}), (X_{1,2}, X_{2,2}), \dots, (X_{1,n}, X_{2,n})$ are same distribution]

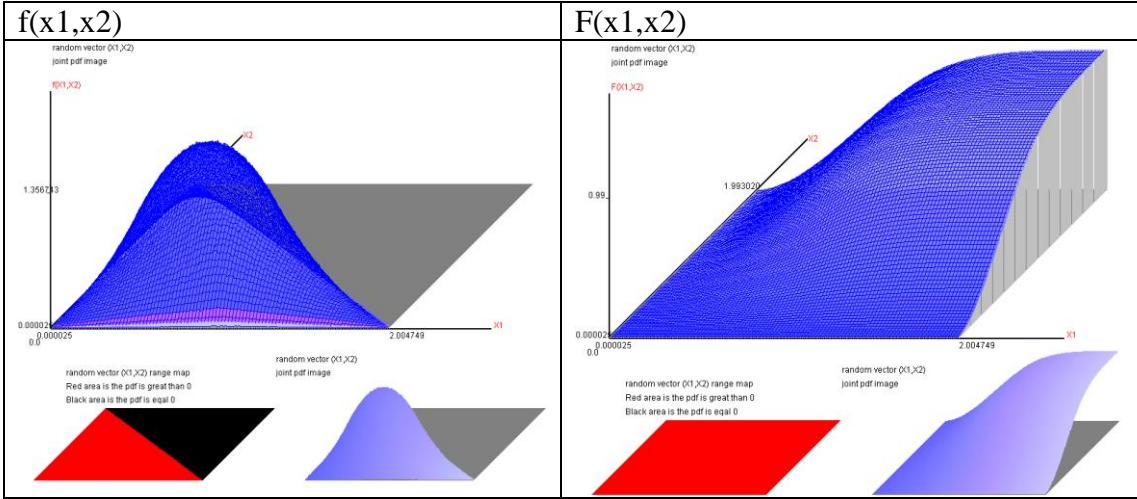

(ii) Repeat n times using the random number and taking the paired data of $(X_{1,1}, X_{2,1})$, the summation of the 1st part ($X_{1,1}$) is the sample data of X_1 and the summation of the 2nd part ($X_{2,1}$) is the sample data of X_2 .

(iii) Finished 100,000,000 times of process (ii), the new database of (X_1, X_2) can represent the Continuous trinomial distribution (λ_1, λ_2) and trial number=n.

(2) The joint probability distribution and marginal probability distribution,

(1)The joint probability distribution of (x_1, x_2) ',n=2,

(1-1) $\lambda_1 = 0.3333$, $\lambda_2 = 0.3333$,

$$E(X_1) = 0.6670, \text{Var}(X_1) = 0.1112, E(X_2) = 0.6663, \text{Var}(X_2) = 0.1111,$$

$$\text{Cov}(X_1, X_2) = -0.0556, X_1 \text{ and } X_2 \text{ correlation coefficient} = -0.5001.$$
